ABSTRACTS:—

Marriages registered in Ireland in each of the Provinces, Counties, and Superintendent Registrars' Districts, in 1888, distinguishing Roman Catholic from Protestant Marriages, and giving the Total Number registered in each Quarter of the Year; the Conjugal Condition of Persons Married; the Number of Minors and of those who signed the Registers by Marks,	44-57
Age of 9,248 Persons married in 1888, distinguishing those of Bachelors, Spinsters, Widowers, and Widows,	58, 59
Marriages, Births, and Deaths registered in each of the Counties, 1888,	60

	Page
Marriages, Births, and Deaths in the Superintendent Registrars' Districts, and portions of Superintendent Registrars' Districts in each County, distinguishing the Sexes and Illegitimate Births,	61-86
Marriages, Births, and Deaths in each of the Superintendent Registrars' Districts in Ireland,	67-69
Births and Deaths in the Registrars' Districts and portions of Registrars' Districts in each County, distinguishing Sexes and Illegitimate Births,	70-83
Births and Deaths in each of these Registrars' Districts which extend into more than one County, distinguishing the Sexes and Illegitimate Births,	94
Births (distinguishing Males and Females) registered in the Provinces, Counties, and Superintendent Registrars' Districts (or portions of such Districts), in each of the Four Quarters of 1888,	96-109
Births (distinguishing Males and Females), registered in each Superintendent Registrar's District in Ireland during each Quarter of the year 1888,	110-112
Deaths (distinguishing Males and Females) registered in each of the Four Quarters of 1888 (or portions of such Districts), in Provinces, Counties, and Superintendent Registrars' Districts,	113-125
Deaths (distinguishing Males and Females) registered in each Superintendent Registrar's District in Ireland during each Quarter of the year 1888,	124-127
Deaths of Males and Females at different Ages registered in 1888, in Provinces and Counties, and in the Superintendent Registrars' Districts, or portions of such Districts in each County,	128-141
Deaths of Males and Females at different Ages in each Superintendent Registrar's District in Ireland,	142-147
Causes of Death of Males and Females in Ireland, at different periods of life in 1888,	148-163
Causes of Death of Males and Females in Ireland, and in each of the Provinces, in 1888,	163-167
Deaths from several Zymotic and other Causes in 1888, in the Provinces and Counties, showing the circumstances as to residence at time of death,	168-169
Deaths from several Zymotic and other causes in 1888, in each Superintendent Registrar's District in Ireland, showing the circumstances as to residence at time of death,	170-177
Deaths from several Zymotic and other Causes in 1888, in those Registrars' Districts in which the principal Urban Sanitary Districts in Ireland are situate, showing the circumstances as to residence at time of death,	178-179
Estimated Population of Ireland in each of the years 1861-88,	180
Population by Sexes and Ages according to Census Returns of 1861, 1871, and 1881,	180
Index to Superintendent Registrars' Districts, and Registrars' Districts,	181-184

REPORT

TO

HIS EXCELLENCY CHARLES STEWART VANE TEMPEST, MARQUIS OF LONDONDERRY,

&c. &c. &c.

LORD LIEUTENANT-GENERAL AND GENERAL GOVERNOR OF IRELAND,

MAY IT PLEASE YOUR EXCELLENCY,—

I have the honour to submit, for your Excellency's consideration, the Twenty-fifth Annual Report on Marriages, Births, and Deaths in Ireland. The tables comprise all the usual details connected with the subject for the year 1888.

GENERAL SUMMARY.

The Marriages registered in Ireland during the year 1888 number 20,060; the Births 109,587; and the Deaths 85,892. Both absolutely and in proportion to the estimated population, the marriages, births, and deaths are under the annual average for the preceding ten years.

The recorded natural increase of population, or excess of births over deaths, was 23,665: the loss by emigration amounted to 78,684; there would thus appear to have been a decrease of 55,019 in the population during the year, but against a portion of this decrease there is a set-off in immigration, of which no official record has been obtained. The estimated population in the middle of the year was 4,777,534.

TABLE I.—Showing for each of the years 1878–88, the estimated Population; the number of Marriages, Births, and Deaths registered, and the number of Emigrants enumerated, with the rates per 1,000 of the estimated Population represented thereby; and the averages for the ten years 1878–87.

YEARS.	* Estimated Population in the middle of each year.	Numbers Registered.			Number of Emigrants as returned by the Enumerators.	Rate per 1,000 of Estimated Population.

There are 2,624 Local Registration Officers holding office directly under the Department or who have entered into bonds with the Registrar-General for the due discharge of their duties. During the year, 1888, 560 cases of vacancies or appointments were dealt with.

I append a table showing the number of Searches, &c., since the commencement of

* See page 180.

the Acts for the Registration of Births and Deaths and of Roman Catholic Marriages in 1864. It will be observed that the steady increase in the number of searches and in the number of certified copies issued noted in recent years was maintained in 1888.

I have pleasure in stating that the work of the Department in its various branches is well up to date.

During this year 1888 two important Publications were issued by the Department—these are digests of the “Irish Marriage Law” and of the “Law for the Registration of Births and Deaths in Ireland,” and were prepared by Mr. Robert E. Matheson, the Secretary of the department. The former work is a new edition of a digest originally prepared by Mr. Matheson, and presented by him in the year 1873 to the Registrar-General of that day—Mr. Donnelly, *c.n.*—Revised editions had been issued in 1878 and in 1883. The work was primarily printed for the use of the officers of the department, but having been found of great use, and a demand having arisen by the public, it was decided to publish a new and enlarged edition which could be used, not only by the department, but also put on sale by Her Majesty's Stationery Office for the use of the public.

The digest of the Law for the Registration of Births and Deaths is an entirely new work and has now been issued for the first time.

MARRIAGES.

I regret to state that in 24 cases returns have not been furnished by the clergy of the late Established Church, and in 5 instances by the Presbyterian clergy (four connected with the General Assembly and one with the Remonstrant Synod of Ulster). The number of marriages celebrated in these churches is known to have been small, and would not appreciably affect the general statistical results for Ireland, but nevertheless it is unsatisfactory to have to notice even any omissions to comply with Sec. 65 of 7 & 8 Vic., cap. 81, under which these returns are required from the clergy.

The number of Marriages registered during the year was 20,060, being equal to 1 in every 288, or 4.20 per 1,000, of the estimated population,* a rate which was ‘18 under that for the previous year, and ‘12 under the average for the ten years 1878-87.

Of the 20,060 Marriages registered during the year 1888, 13,361 were between Roman Catholics, 3,601 were celebrated according to the rites and ceremonies of the late Established Church; 2,247 were in Presbyterian Meeting-houses; 394 in “Registered Buildings” belonging to various religious denominations; only 437 by civil contract in the Registrars' offices; 12 were according to the usages of the Society of Friends; and 8 according to the Jewish rite.

Of the 3,601 Marriages according to the rites of the late Established Church, 44 were by special licence, 3,046 by licence, 452 after the publication of banns, 2 on Registrar's certificate, and in 57 instances there was no information afforded as to which of the foregoing methods was adopted.

* Throughout this Report the rates for the total of Ireland are based on the estimated population in the middle of the respective years; those for the Provinces and Counties on the population according to the Census of 1881.

TABLE III.—Marriages registered in Ireland in 1888 and each of the previous ten years, according to the modes of celebration; with the rate per 1,000 of the population represented:—

During the year 1888 there were issued by the Registrars 699 Licences for Marriage in Registered Buildings and in the Registrars' offices.

The number of Marriage Licences issued by the licensing Ministers of the several Presbyterian bodies is given in the following summary:—

Presbytery or Synod.	Number of Licensing Ministers on 31st December, 1888.	Number of Registered Marriage Licences on 31st December, 1888.	Number of Marriages Issued.
1. General Assembly of the Presbyterian Church in Ireland,	164	667	2,100
2. Remonstrant Synod of Water,	2	12	46
3. Presbytery of Antrim,	4	2	1
4. United Presbytery or Synod of Munster,	4	2	1
5. Northern Presbytery of Antrim,	2	0	0
Total,	180	683	2,148

There being no civil restrictions as to the time or place for celebrating marriages between Roman Catholics in Ireland, a registration of the churches and chapels of the Roman Catholic Church is not necessary for the purposes of this office; but with reference to other religious bodies, a record is kept of the places of Divine worship in which marriages may lawfully be solemnized without special licence, and from this it appears that, on the 31st December, 1888, there were 1,426 churches and chapels of the late Established Church, 599 registered Presbyterian Meeting-houses, and 345 "Registered Buildings" belonging to various religious denominations. Compared with the previous year, these numbers show a decrease of 1 as regards the late Established Church, an increase of 3 in the number of Presbyterian Meeting-houses, and an increase of 5 "Registered Buildings."

The following statement shows the several religious bodies having "Registered Buildings" in 1888:—

Denominations.	No. of Places of Worship.	Denominations.	No. of Places of Worship.	Denominations.	No. of Places of Worship.
Methodists,	206	Salvation Army,	4	United Original Seceders,	1
Reformed Presbyterians,	37	Christian Brethren,	5	"Protestant Dissenters,"	1
Independents,	96	Evangelical Union,	2	Non-Subscribing Christians,	1
Baptists,	19	Non-Subscribing Unitarians,	2	"The Catholic Apostolic Church,"	2
Seceders,	10	Jews,	2	Independent Protestants,	1
United Presbyterians,	11	Unitarians,	1		
Methodists, New Connexion,	6	Covenanters,	1	Total,	345
Moravians, or United Brethren,	7				

As more than a moiety of the annual number of Roman Catholic marriages in the provinces of Munster and Connaught are celebrated between Christmas and Shrovetide, the marriages registered in Ireland during the first quarter of the year always largely outnumber those in any of the other quarters. In 1888, the numbers recorded were— in the first quarter 6,344; in the second, 4,670; in the third, 4,501; and in the last 4,545.

The marriages of bachelors and spinsters constitute 86·0 per cent. of the total; those of widowers and spinsters 3·6 per cent.; of bachelors and widows 3·0 per cent.; and of widowers and widows 2·4 per cent. Thus, 11 in every 100 of the men married were widowers, and 5·4 per cent. of the women were widows; and in 14 instances in every 100 marriages one or both of the contracting parties had been in the married state before.

TABLE IV.—Showing by QUARTERLY PERIODS, the number of MARRIAGES registered in Ireland in the eleven years 1878-88, and the average number for the ten years 1878-87, distinguishing the number of Roman Catholic marriages registered under the 26 & 27 Vic, cap. 96, and of Protestant and other marriages under the 7 & 8 Vic, cap. 51:—

A complete registry of the exact ages of the persons married would be valuable from many points of view; hence it is matter for regret that in the great majority of instances the ages are not recorded. The requirements of the law are technically complied with by the entry in the age column of "minor" or of "full age," as the case may be, and there seems to be a general and increasing inclination to take advantage of this circumstance, as in 1888 the ages of both parties were specified in only 4,624 instances, being less than one-fourth of the total number of marriages. In the year 1885, when 30,802 marriages were registered, the ages of both parties were given in 13,910 instances.

Of 20,060 men married during the year, 441, or 2·20 per cent., were minors; and of the women married, 2,027, or 10·10 per cent., were under age. These proportions are somewhat under the averages for the preceding ten years.

The highest proportion of husbands (2·65 per cent.) married under age in 1888, was in the province of Ulster, and in that province there was also the highest per-centage of wives (11·16), not of full age.

It may be added that the per-centage of persons married in Ireland who were under age is very far below the corresponding rates in England and Scotland.

The signatures of the contracting parties in the marriage registers or certificates afford a rough test of the progress of elementary education. In the year 1888, 15,770, or 78·6 per cent., of the husbands, and 15,397, or 76·8 per cent., of the wives wrote their names, and the remainder signed by marks.

These figures, though still leaving much to be desired, contrast hopefully with the corresponding results eleven years since, the per-centage of persons married in 1878 who wrote their names being—men 71·5, and women 66·8.

As usual, the most favourable results appear in Leinster, and the least satisfactory in Connaught, the number of those married who wrote their names varying from 83 in every 100 men and 83 in every 100 women, in the former province, to 71 per cent. of the men and 71 per cent. of the women in the latter.

In 2,426 instances, both of the parties married signed the register by "mark," and in 4,101 cases the register was thus signed by either the husband or the wife, so that in 6,527 instances, or 32·5 per cent. of the total number of marriages, one or both of the parties signed by mark; and in 13,533 instances, or 67·5 per cent., both parties wrote their names.

The number of marriages registered in each of the eleven years 1878-88; the proportion per cent. of persons married who wrote their names in the registers; of minors, of widowers, and of widows are given in the following Table for Ireland, and for each of the four provinces.

TABLE V.—Showing as regards the Marriages in Ireland and in each of the Four Provinces during the years 1878-88, the proportion per cent. of Persons who signed their Names, of Persons not of Full Age, and of Re-marriages. The figures for the years 1878-84 refer to Registration Provinces; those for 1885, 1886, 1887, and 1888 to the Provinces Proper.

In proportion to the estimated population at all ages, the registered marriages were most numerous in the province of Ulster, in which, however, the rate was only 4.7 per 1,000 of the population in 1881; Leinster comes next, with 4.4 per 1,000; Munster third, with 3.1 per 1,000; and Connaught last, the rate being 2.6 per 1,000.

The highest rate for any county was 7.1 per 1,000 of the population in 1881, which was the marriage rate for Antrim; and the lowest 2.4 per 1,000, for Clare, Galway, and Sligo respectively. Between these, the most favourable were 6.5 for Dublin, and 5.1 for Down; and the least so 2.6 for Leitrim and 2.7 for Kerry, Mayo, and Roscommon.

BIRTHS.

The number of births registered during the year 1888 was 109,557—56,186 boys and 53,371 girls, or 105.3 of the former to every 100 of the latter—the rate afforded in proportion to the estimated population being 1 in 43.6, or 22.9 per thousand, which is 1.2 under the low average rate for the ten years, 1878-87, and less than the rate in any of those years.

Of the 109,557 children whose births were registered in Ireland during the year 1888, 106,433, or 97.1 per cent. were legitimate, and 3,124, or 2.9 per cent., were illegitimate. The average per-centage of illegitimate births in the preceding 10 years was 2.6. It is unnecessary to say that these results compare very favourably with the returns for most other countries.

Of the children born in wedlock during the year, 54,549 were males, and 51,884 females, being 105·1 of the former to every 100 of the latter, and of the illegitimate children 1,637 were males, and 1,487 females, or 110·1 boys to 100 girls.

Comparing the provinces, we find that the per-centage of children born in Ulster, who were illegitimate, was 4·4; in Leinster, 2·5; in Munster, 2·2; and in Connaught, 0·7.

TABLE VI.—The Per-centage of Legitimate and of Illegitimate Births registered in Ireland during the years 1884-88, by Provinces.

Provinces.	Proportion per cent. of Legitimate Births.					Proportion per cent. of Illegitimate Births.				
	1884.	1885.	1886.	1887.	1888.	1884.	1885.	1886.	1887.	1888.
IRELAND, . . .	87·6	87·3	87·2	87·3	87·1	12·7	12·8	12·7	12·7	12·9
LEINSTER, . . .	87·3	87·7	87·9	87·7	87·8	12·6	12·3	12·1	12·3	12·2
MUNSTER, . . .	87·6	87·6	87·9	87·6	87·6	12·4	12·4	12·1	12·4	12·4
ULSTER, . . .	80·0	80·7	80·0	80·4	80·8	19·1	19·3	19·9	19·6	19·2
CONNAUGHT, . . .	89·3	89·1	89·2	89·4	89·2	10·7	10·9	10·8	10·4	10·8

The respective total birth-rates for the provinces in 1888 were—Leinster, 21·8 per 1,000 of the population in 1881; Munster, 20·0; Ulster, 22·4; and Connaught, 19·4.

The four counties having the highest rates are Antrim, 23·4 per 1,000 of the population in 1881; Dublin, 27·6; Down, 25·1; and Londonderry, 21·9. Those with the lowest rates are—Monaghan, 16·8; Longford, 17·1; Queen's and Meath, 17·5 respectively.

Of the total births, 52·7 per cent. were registered in the first six months of the year (182 days), and 47·3 per cent. in the second half of the year (184 days).

The number registered in the first quarter was 23,961; in the second, 23,731; in the third, 26,003; and in the fourth, 25,862.

DEATHS.

The deaths registered during the year amount to 35,892, being equal to 1 in 55·6 or 18·0 per 1,000 of the estimated population. The deaths of males number 42,674, and those of females 43,418, the former being equal to 18·1 in every 1,000 males living, and the latter representing 17·8 per 1,000 females.

The death-rate (18·0) is somewhat under the average rate (18·4) for the preceding ten years.

As heretofore, very many of the Registrars furnished at the close of each quarter valuable notes on the sanitary condition of their respective districts. These notes were embodied in the Quarterly Returns issued from this department, and emanating as they did, from gentlemen qualified to speak decisively on the subject, it is to be hoped that they received the serious attention of the various Local Authorities intrusted with the administration of the Public Health Acts.

With respect to the death-rates for the four provinces, the rate for Connaught is only 12·8; that for Munster is 15·3; for Ulster, 17·0, and for Leinster, 19·4 per 1,000 of the population in 1881.

Of the thirty-two counties, the four having the lowest registered mortality are—Sligo, 12·4 per 1,000; Roscommon, 12·5; Galway, 12·6; and Donegal, 12·6.

Those in which the rate was highest are—Dublin, 24·3; Antrim, 21·3; Wexford, 19·8; and Down, 18·9.

The deaths registered in the first half of the year generally outnumber those in the

second. In 1888, 58·4 per cent. of the total deaths were registered in the six months, January to June inclusive, and only 41·6 per cent. in the remaining six months of the year.

The annual rates represented by the deaths registered in each quarter are as follow:—First quarter, 22·8 per 1,000 of the population; second, 19·2; third, 14·2; and fourth, 15·7.

From the Table on pp. 168–177, it will be seen that, of the 85,892 deaths registered during the year, 1,953 took place in *Infirmaries and General and Special Hospitals*; 779 in *Public Lunatic Asylums*; 9,954 in *Workhouses and Workhouse Hospitals*; and 73,206, were of persons who died “*At their Own Homes, &c.*” As in the Report for the preceding year an additional Table (see pages 178–179) is given showing like information for those Registrars’ Districts in which the principal Urban Sanitary Districts in Ireland are situated.

The deaths in “*Infirmaries and General and Special Hospitals*” constitute 2·3 per cent. of the total number, the per-centages for the four provinces varying from 0·5 in Connaught to 5·6 in Leinster. Twelve per cent. of the deaths registered occurred in Workhouses or Workhouse Hospitals, the respective per-centages for the provinces being—Leinster, 13·2; Munster, 17·0; Ulster, 7·4; and Connaught, 8·7.

TABLE VII.—Showing, by Quarterly Periods, the number of Births and Deaths registered in Ireland in each of the eleven years, 1878–88, and the average number for the ten years, 1878–87.

I.—SPECIFIC FEVERS OR ZYMOTIC DISEASES.

The deaths from Specific Fevers or Zymotic diseases registered during the year 1883, amounted to 8,164, or 17.1 in every 100,000 of the estimated population, being 21.4, or 4 per 100,000 persons, below the deaths from these causes in the preceding year, and much below the average for the ten years, 1878-87.

Of the 8,164 deaths from zymotic diseases 5,193, or 63.7 per cent., were amongst children under 10 years of age.

The deaths from the eight principal zymotic diseases* registered during 1888 form 8·4 per cent. of the deaths from all causes, and are equal to 150 in every 100,000 persons living; the average annual mortality from the same diseases in the preceding 10 years represents 9·2 per cent. of the average number of deaths from all causes, and is equal to 170 deaths in every 100,000 of the estimated mean population.

* Small-pox, Measles, Scarlet Fever, Diphtheria, Whooping-cough, Fever, Diarrhoea (and Dysentery), and Cholera.

TABLE IX.—Showing the Number of Deaths from the Principal Febrile or Zymotic Diseases registered in Ireland during the year 1883, and the Average Annual Number for the ten years 1873-82; with the Number registered in the several Provinces during each of the four years 1883-6-7-8; and the Rates per 100,000 of the Population.*

Small-pox.—The number of deaths from small-pox registered during last year is 3, of which 1 occurred in Leinster and 2 in Ulster. The average annual number of deaths from this disease for the ten years, 1878-87, was 217. In 1883 there were but 16 fatal cases of the disease recorded; in 1884, 1; in 1885, 4; in 1886, 2; and in 1887, 14.

Measles.—Deaths from measles, which had fallen from 1,323 in 1885, to 254 in 1886, rose to 1,307 in 1887, with a further rise of 628, to 1,935 last year, or 40.5 per 100,000 of the population. The 1,935 deaths consist of 359 in Leinster; 868 in Munster (including 238 in Cork union, 65 in Skibbereen union, 50 in Killarney union, and 61 in Tralee union); 599 in Ulster (including 234 in Belfast union and 74 in Newry union); and 89 in Connaught.

* See note (F), page 8.

Scarlet Fever.—The number of deaths from this disease is 849, being a decrease of 124 as compared with the preceding year; the mortality from scarlatina last year is the lowest in any year since registration was established in 1864, and the number of deaths is 541 under the average number for the ten years 1878–87.

The deaths from scarlet fever in 1888 were distributed through the four provinces as follows:—Leinster, 384 (including 167 in the Dublin Registration District and 36 in Balrothery union); Munster, 212 (of which number 46 occurred in Limerick union); Ulster, 176 (53 of which occurred in Belfast union, and 32 in Newry union); and Connaught, 77 only.

In Leinster, deaths from scarlet fever were equal to 30·0 per 100,000 of the population; in Munster, the rate was 15·9 per 100,000; in Ulster, 10·1; and in Connaught 9·4 only.

Diphtheria.—This disease proved fatal in 447 instances, being 123 in excess of the average annual number for the ten years 1878–87, and 66 over the number for the year 1887. In proportion to population the highest mortality (14·1 per 100,000 persons) was in the province of Ulster, where 246, or more than half of the deaths from this cause occurred.

Whooping-cough.—The deaths (1,359) from whooping-cough are 127 under the number for the preceding year, and 401 below the average for the ten years 1878–87; they afford an annual rate of 26·3 per 100,000 of the estimated population. In proportion to population the mortality was highest in Leinster and lowest in Munster, the rates for these provinces being 36·0 and 16·8 per 100,000 persons respectively. Two hundred and sixty-nine deaths from whooping-cough occurred in the Dublin Registration District, 152 in Belfast union, and 67 in Cork union.

Fever.—The number of deaths from the several forms of continued fever was 1,433 (736 males and 697 females), being the lowest number registered in any year since registration was established in 1864; the average annual number for the ten years 1878–87, was 2,249; the number in 1887 was 1,530. The deaths recorded during last year are equal to a rate of 30·0 per 100,000 of the estimated population; the respective rates for the provinces being—Leinster, 34·1 per 100,000 of the population in 1881; Munster, 27·9; Ulster, 23·7; and Connaught, 25·9.

Of the registered deaths from fever, 362 were ascribed to typhus, 741 to typhoid or enteric, and 330 to simple continued fever, or vaguely as to “fever.” One hundred and sixty-six of the 741 deaths from enteric fever occurred in the Dublin Registration District and 96 in the City of Belfast. The age periods, 15 and under 20 years, and 20 to 25, were those in which fever proved most fatal in proportion to the living at the same ages; the former yielding a rate of 47·67 per 100,000, and the latter 42·31. The lowest rate was 19·93 for the period “under 5 years old.”

TABLE X.—Showing for the year 1888 the Deaths from the several forms of Fever at each Age-Period, with the proportion to the number of the living at each Age represented thereby.

Erysipelas.—The deaths from erysipelas number 260, being an increase of 13 as compared with the number for the preceding year, and 1 over the average for the ten

years, 1878-87. The highest mortality in 1888, in proportion to population, was in Leinster, and the lowest in Connaught.

Puerperal Fever.—The number of deaths from this disease registered in 1888 was 345, being 6 over the average for the ten years, 1878-87, and 29 above the number in the year 1887.

Influenza.—There were 44 deaths ascribed to this disease; the number in 1887 was 26, and the annual average for the ten years, 1878-87, was 52.

Diarrhœa and Dysentery.—The mortality from diarrhœa and dysentery was much below the average for the ten years, 1878-87, the number of deaths being 1,212 (equal to 25·4 per 100,000 of the population), or 577 under the number for the preceding year.

The rates for the provinces in 1888 were as follow :—Leinster, 30·6 per 100,000 persons; Munster, 28·5; Ulster, 22·7; and Connaught 18·6.

Simple Cholera.—Forty-one deaths were ascribed to this disease—6 below the annual average for the ten years 1878-87.

Eight males and three females died from *Hydrophobia*.

II.—PARASITIC DISEASES.

There were only 79 deaths caused by diseases of this class.

III.—DIETETIC DISEASES.

The deaths in this class number 139; they comprise 138 from intemperance, 38 of which (34 males and 4 females) were caused by delirium tremens, and 100 (77 males and 23 females) come under the head of chronic alcoholism. In the preceding year 126 deaths from intemperance were registered.

IV.—CONSTITUTIONAL DISEASES.

From diseases termed "constitutional" there resulted 15,633 deaths (7,385 males and 8,248 females), affording a rate of 1 in 5·5 of all the deaths, and equal to 327 in every 100,000 of the population.

Phthisis or Pulmonary Consumption proved fatal in 9,812 instances (4,602 males and 5,210 females) being equal to 205·4 in every 100,000 persons; the average annual number for the previous ten years was 10,552.

As heretofore, Leinster and Ulster yield the highest rates, and Connaught the lowest. The rates for the four provinces are as follow :—Leinster, 223 per 100,000 of the population; Ulster, 215; Munster, 164; and Connaught, 124.

Of the total deaths from phthisis, 7,181, or 73 per cent., were of persons between 15 and 45 years of age.

Mesenteric Disease.—The deaths from mesenteric disease number 997—481 males and 516 females.

Gout.—Only 34 deaths from gout were registered (17 males and 17 females).

Cancer.—There were 2,003 deaths tabulated under this heading, of which 880 were those of males and 1,123 of females.

The following Table shows, by Sexes and Age-periods, the deaths from Cancer registered during the year 1888, arranged according to the part of the body affected by the disease, in so far as that information was contained in the Returns; also the number of deaths to 100,000 of the living at same age. In 67 instances the organ or portion of the body affected was not stated, and it will be observed that 526 of the 1,936 classified cases were deaths from cancer of the stomach, and that 263 females died from cancer of the breast, and 164 from cancer of the uterus. The Table shows also the total deaths from cancer in each of the ten years, 1878-87, arranged by Age-periods.

* Including 12, scrotum; 14 each, penis and vagina; 2 each, bladder and prostate.

V.—DEVELOPMENTAL DISEASES.

The deaths in this class amount to 17,187, of which 16,764 (7,593 males and 9,171 females) were ascribed to "old age." Of the remaining 423 deaths, 335 are tabulated under the head of "premature birth"; 25 were caused by atelectasis, 11 by cyanosis, 33 by spina bifida; &c.

VI.—LOCAL DISEASES.

The number of deaths from "local diseases" registered amounted to 36,485 (18,876 males and 17,609 females), or 1 in 2.4 of the deaths from all causes.

Diseases of the Nervous System.—From this group of diseases there resulted 8,276 deaths—4,414 males and 3,862 females. They include 2,908 from convulsions (nearly all children), 1,534 from hemiplegia, brain paralysis, 1,127 from apoplexy, 923 from inflammation of the brain or its membranes, 374 from epilepsy, 292 from insanity (general paralysis of the insane), 4 (2 males and 2 females) from chorea or St. Vitus's dance, 220 from softening of the brain, &c.

Diseases of the Circulatory System.—Diseases of the circulatory system caused 5,321 deaths—2,678 males and 2,643 females.

Diseases of the Respiratory System.—The deaths from these diseases, amounted to 15,286 (7,947 males and 7,339 females), being equal to 322.0 in every 100,000 of the population. The average number for the preceding ten years was 16,335, the annual numbers varying from 14,046 in 1884 to 15,634 in 1879. The respective rates for the Provinces, in 1888, are Leinster, 346.8 per 100,000 persons; Munster, 298.5; Ulster, 301.9; and Connaught, 208.8.

* Exclusive of Phthisis, or Pulmonary Consumption, for which see "Constitutional Diseases."

Of the 15,386 deaths from these causes 9,990 (4,819 males and 5,171 females), resulted from bronchitis; 3,050 (1,882 males and 1,168 females) were from pneumonia or inflammation of the lungs; 932 from croup; 279 from asthma and emphysema; 236 from pleurisy; 189 from laryngitis, &c.

Diseases of the Digestive System.—These diseases contributed 4,627 deaths (2,394 males and 2,233 females). They include 413 from enteritis or inflammation of the bowels; 428 from peritonitis or inflammation of the covering of the bowels; 413 from ileus or obstruction of the bowels; 227 from ulceration of the intestines; 147 from hernia; 12 (7 males and 5 females) from fistula; 244—165 males and 79 females—from cirrhosis of liver; &c.

Diseases of the Urinary System.—To the various affections of this order of diseases 1,573 deaths (1,086 males and 487 females) were ascribed. Of these deaths, 636 (384 males and 252 females) were from Bright's disease, 168 from acute nephritis or inflammation of the kidneys; 21 from ischuria or suppression of urine; 11 from stone in the bladder; 66 from uræmia, &c.

The remaining deaths from Local Diseases comprise 50 from *Diseases of the Lymphatic System and of Ductless Glands*; 662 from *Diseases of the Reproductive System* (including 161 from diseases of the Organs of Generation, and 501 from the Accidents of Childbirth), 285 from *Diseases of the Organs of Locomotion*; and 251 from *Diseases of the Integumentary System*.

VII.—VIOLENT DEATHS.

The number of violent deaths registered during the year was 1,738 (1,136 males and 602 females), or 36·4 in every 100,000 of the population, being somewhat under the average rate for the ten years 1878-87. Accidents or negligence caused 1,512 of these deaths (including 613 from fractures and contusions, 358 from burns or scalds; and 297 from drowning); there were 107 cases of homicide (murder and manslaughter), and 116 of suicide. Four men were executed, all in Munster.

Inquests.—There were 1,949 inquests reported to the Registrars during the year 1888, being 1 inquest to every 44 deaths registered.

AGES.

Deaths of infants under 1 year old numbered 10,619, being equal to 27 per cent. of the number of births registered.

Amongst children under 5 years of age 12,095 deaths occurred—a mortality equal to 35·9 in every 1,000 of the living at that age. Of these, 10,269 were boys and 1,826 girls; the former number representing 39·4 in every 1,000 boys, and the latter 32·5 in every 1,000 girls under 5 years old.

The deaths of persons aged 65 years and upwards are equivalent to 27 per cent. of the living at that age.

Amongst the deaths registered are 662 of persons stated to have been aged 95 years or upwards—312 males and 350 females; and of these 208 (87 males and 121 females) were returned as having been 100 years of age or upwards, and further inquiry having been made it was ascertained that the ages of the centenarians as given in the records were in every instance confirmed.

EMIGRATION.

According to the Returns obtained by the Royal Irish Constabulary and the Metropolitan Police, who acted as enumerators at the several Irish seaports, the number of emigrants who left Ireland during the year 1888 amounted to 78,684; of these 41,810 were males and 37,374 were females. Of the whole number, 13,830 were from the Province of Leinster; 27,719 from Munster; 21,667 from Ulster; and 15,468 from Connaught.

Of the total emigrants from Ireland in 1888, 10·5 per cent. were under 15 years of age; 30·1 per cent. were between 15 and 25 years old; 9·1 per cent. were 35 or upwards; and in 283 instances, or 0·3 per cent., the ages were not specified.

PRICES OF PROVISIONS, AND PAUPERISM.

The average price of the 4 lb. loaf in Dublin was 6d., being ½d. over the average price for 1887. Oatmeal averaged 13s. 10d. per cwt. in Dublin, being 1s. 2d. under average price for 1887; the average prices of potatoes in Dublin ranged from 2s. 2d. to 2s. 9d. per cwt., against 3s. to 4s. 3d. in 1887; and those of beef from 50s. 6d. to 60s. per cwt., against 44s. to 53s. 6d. in 1887.

TABLE XII.—AVERAGE PRICES IN DUBLIN OF BREAD, OATMEAL, POTATOES, AND BEEF, during the years 1878-88, and the AVERAGE NUMBER of PERSONS in IRELAND receiving IN-DOOR and OUT-DOOR RELIEF on Saturdays in those years; also the AVERAGE PRICES of PROVISIONS and the AVERAGE NUMBER of PERSONS in RECEIPT of RELIEF during each quarter of the year 1888.

* Prices for years 1878-87, and first two quarters of 1888, were derived from Returns furnished by Messrs. Munnell & Co., for the third and fourth quarters of 1888 from Returns received from "Soland's, Limited," and Messrs. Johnston & Co.—the prices quoted for these last three including delivery.

† Compiled from Returns furnished by the Local Government Board.

Surveying the period covered by the several Tables in this Report, i.e., 1888, and the ten years preceding, it is found that beef was lowest in the year 1887, when the average prices ranged from 44s. to 53s. 6d. per cwt.; bread was lowest in the years 1886 and 1887, the average price of the 4-lb. loaf being 5½d.; oatmeal was cheapest last year, when the average price was 13s. 10d. per cwt.; and potatoes also in 1888, when the average range of prices was from 2s. 2d. to 2s. 9d. per cwt. The highest average price of bread was 7½d. in the year 1878; of oatmeal, 17s. 6d. in 1884 and 1885; the highest range for potatoes, 4s. 9d. to 7s. 6d. per cwt. in 1878, and for beef, 66s. 6d. to 77s. per cwt. in 1888.

From Returns, for which I am indebted to the Local Government Board, it appears that the average number of workhouse inmates in Ireland on Saturdays during the year 1888 was 45,638, being 804 under the average for the preceding year; and that the average number of persons receiving out-door relief was 63,775, or 1,882 under the corresponding number for 1887.

THE WEATHER.

The following particulars and those given on pages 22-29, which are inserted by the kind permission of the Editor of the Dublin Journal of Medical Science, have been derived from Returns of Meteorological Observations taken in Dublin City during the

years 1868-88, by J. W. Moore, Esq., M.D., F.R.Q.C.P.L., F.R. MET. SOC.; and published in the *Journal* during the years 1888-89; the Tables on pages 40-2 also, are founded on Dr. Moore's observations:—

The mean Atmospheric Pressure has been obtained from daily readings of the barometer at 9 A.M. and 9 P.M., corrected and reduced to 32° Fahrenheit at the mean sea level. The Mean Temperature values have been deduced from the maximal and minimal readings of the thermometer in the shade by Kaemtz's Formula, viz., $\text{min.} + (\text{max.} - \text{min.} \times .41) = \text{Mean Temperature}$. The Rainfall is that measured daily at 9 A.M. A rainy day is one on which at least one-hundredth ($\frac{1}{100}$) of an inch of rain falls within the twenty-four hours from 9 A.M. to 9 A.M.

The Mean Height of the Barometer during the year 1888 was 29.939 inches. The highest observed reading was 30.686 inches at 9 A.M. on January 13th. The lowest observed reading was 28.556 inches, at 1 P.M. on March 28th. The extreme range of atmospheric pressure was 2.130 inches compared with 2.143 inches in 1887.

The Mean Temperature of the year, deduced from the maximal and minimal readings of the thermometer in the shade by Kaemtz's Formula, was 47.8°. The highest reading was 78.4° on June 26th; the lowest reading was 24.6° on February 14th. The average mean temperature for the years 1868-87 calculated in the same way, was 48.7°. The mean temperature deduced from the daily readings of the dry bulb thermometer at 9 A.M. and 9 P.M. was 48.3°.

Rain fell on 190 days, including snow or sleet on 28 days, and hail on 33 days. The average number of rainy days in the years 1868-87 was 195.0. The total rainfall measured 28.679 inches, compared with an average of 27.795 inches in the twenty years 1868-87. During the first half of 1888 (January to June, inclusive) the rainfall was 12.113 inches on 87 days; during the second half (July to December, inclusive) 16.566 inches fell on 103 days.

As regards the Direction of the Wind, 732 observations were made during the year, with this result—N., 61; N.E., 91; E., 62; S.E., 51; S., 68; S.W., 90; W., 169; N.W., 86; Calms, 44.

I have the honour to be

Your Excellency's faithful servant,

THOS. W. GRIMSHAW,

Registrar-General.

GENERAL REGISTER OFFICE,

CHARLEMONT HOUSE,

Dublin, 3rd August, 1888.

METEOROLOGICAL OBSERVATIONS

By J. W. MOORE, Esq., M.D., F.R.S.C.P.I., F.R. MET. SOC.

(Extracted from the *Dublin Journal of Medical Science*.)

JANUARY.—During the greater part of the month the weather was open, although changeable in Ireland, colder in England, and very cold in France and Germany. The type of distribution of atmospheric pressure was chiefly anticyclonic in the south, cyclonic in the far north and north-west. A remarkably persistent anticyclone prevailed in Western Europe from the 7th to the 21st. This system first moved slowly northwards from Spain to the south of Scandinavia, and then changed its course, travelling southwards again. In front of it very warm westerly winds were found, but as it encroached upon the United Kingdom the air became still, temperature fell, and dense fogs formed. During the first few days heavy southerly gales were experienced in Ireland at a time when intense frost held on the Continent. These gales scarcely extended even as far eastward as England.

In Dublin the mean temperature ($42^{\circ}1'$) was perceptibly above the average ($41^{\circ}4'$); the mean dry bulb readings at 9 a.m. and 9 p.m. were $41^{\circ}5'$. In the twenty-three years ending with 1887, January was coldest in 1881 (M. T. = $33^{\circ}2'$) and warmest in 1875 (M. T. = $46^{\circ}6'$). In 1897, the M. T. was $35^{\circ}7'$, and in 1865 it was $37^{\circ}8'$. In 1871 and in 1886, the M. T. was $37^{\circ}9'$; in the year 1879 (the cold year) it was $35^{\circ}3'$. As a general rule, January in Dublin is not colder, but rather a shade warmer, than December. This is owing to the full development in January of a winter area of low pressure over the Atlantic to the north-westward of the British Isles and to a resulting prevalence of S. W. winds in their vicinity. January, 1888, proved an exception to this rule.

The mean height of the barometer was 30.102 inches, or as much as 0.311 inch above the average value for January—namely, 29.881 inches. The mercury rose to 30.686 inches at 9 a.m. of the 13th, and fell to 29.183 inches at 9 a.m. of the 2nd. The observed range of atmospheric pressure was, therefore, as much as 1.503 inches—that is, a little over one inch and one-half. The mean temperature deduced from daily readings of the dry bulb thermometer at 9 a.m. and 9 p.m. was $41^{\circ}5'$, or $2^{\circ}9'$ above the value for December, 1887; that calculated by Knott's formula from the means of the daily maxima and minima was $41^{\circ}3'$, or $0^{\circ}5'$ above the average mean temperature for January, calculated in the same way, in the twenty years, 1868–84, inclusive ($40^{\circ}8'$). The arithmetical mean of the maximal and minimal readings was $42^{\circ}1'$, compared with a twenty years' average of $41^{\circ}4'$. On the 9th the thermometer in the screen rose to $53^{\circ}5'$ —wind W.S.W.; on the 29th the temperature fell to $25^{\circ}5'$ —wind W. The minimum on the grass was $19^{\circ}4'$ on the same date. The rainfall was only 1.247 inches, distributed over nine days. The average rainfall for January in the twenty years, 1868–84, inclusive, was 2.243 inches, and the average number of rainy days was 17.1. The rainfall and the rainy days, therefore, were both greatly above the average. In 1877 the rainfall in January was very large—4.622 inches on 25 days; in 1869 also 4.258 inches fell—on, however, only 18 days. On the other hand, in 1876, only .496 of an inch was measured on but nine days; and in 1880, the rainfall was only .565 of an inch on but eight days. In January, 1888, 3.244 inches of rain were measured on as many as 25 days, and in 1887 1.816 inches fell on 16 days.

A solar halo was seen on the 1st, and lunar halos appeared on the 22nd, 23rd, and 24th. The atmosphere was foggy on the 9th, 10th, 11th, 12th, 13th, 14th, 19th, 20th, 29th, and 29th. High winds were noted on 18 days, reaching the force of a gale on four days—the 3rd, 4th, 25th, and 31st. Hail fell on the 1st and 19th, and snow or sleet on the 1st, 30th, and 31st. Temperature exceeded 50° in the screen on 10 days, compared with seven days in December, 1887; while it fell to or below 32° in the screen on only three days, compared with seven days in December. The minima on the grass were 32° , or less, on 17 nights, compared with 26 nights in December.

The first week of the new year (ending Saturday, January 7th) witnessed the substitution of warm, damp, squally weather, for the cold, dull conditions which held during the latter part of December. Sunday was very cold, and at night hail, snow, sleet and rain fell abundantly. On Tuesday and Wednesday a strong, southerly gale blew on the Irish coast, accompanied with a heavy rainfall. The last three days were mild and fine. The mean dry bulb temperature was $43^{\circ}4'$, or 3° above the average—the extremes were: highest, $52^{\circ}5'$ on Saturday; lowest, $33^{\circ}6'$ on Sunday. The mean height of the barometer was 29.653 inches, pressure ranging from 29.183 inches at 9 a.m. of Monday, to 30.254 inches at 9 p.m. of Saturday. Rain fell on three days to the amount of .899 inch, the maximal fall in 24 hours being .350 inch on Tuesday.

Throughout the second week (8th–14th) conditions were anticyclonic over nearly the entire of Western Europe. Consequently, quiet, foggy, dull weather prevailed. The fog, which accompanied the anticyclone, was probably unprecedented for its extent, intensity, and persistence. Before it formed on Monday evening a warm S. W. current of air raised the shade temperature to 58° at Mullaighmore, County Sligo, and in Dublin, while from the north-east of England a value as high as 63° was reported. With the onset of the fog, the diurnal range of temperature became very small. Monday was in Dublin bright and warm as September. On Tuesday the sun shone dimly through the fog, but after that day the sky was almost constantly covered with a dense cloud-canopy. The darkness on Friday was phenomenal at times. In Dublin the mean height of the barometer was 30.540 inches, and the range of pressure was only .266 inch—from 30.420 inches at 9 a.m. of Sunday to 30.686 inches at 9 a.m. of Friday. The mean dry bulb temperature was $42^{\circ}8'$ —extremes being, highest, $58^{\circ}8'$ on Monday; lowest, $36^{\circ}2'$ on Thursday. Rain fell on Sunday to the amount of only .610 inch.

During the week ending Saturday, the 21st, dull, cold weather prevailed until Friday, when a considerable rise of temperature occurred as a westerly current displaced the easterly winds which had previously been blowing. At first the air was very searching, but afterwards it was soft and ex-

cessively damp. On Tuesday forenoon and Wednesday afternoon the sun shone brightly. Light showers of hail fell on Thursday, and towards evening a warm rain fell in showers. There was a considerable rainfall (≈ 102 inch) on Friday night also, subsequently to the clearing of a dense, damp fog, which had hung over the city on that day. In Dublin the mean pressure was 30.420 inches, the barometer ranging from 30.388 inches at 9 p.m. of Wednesday, to 29.880 inches at 9 p.m. of Saturday. The mean dry bulb temperature was 40.2° —highest being 53.6° on Saturday; lowest, 32.7° on Thursday. Rain fell on two days to the amount of 172 inch—the heaviest fall being 102 inch on Friday.

In the fourth week (22nd–28th) the weather was at first mild and chiefly fine, but afterwards became cold, clear, and dry, and on Saturday a sharp frost occurred—the thermometer falling to 20.0° on the grass, and to 37.4° in the screen. Atmospheric pressure was again much above the average—the mean being 30.210 inches; the highest, 30.464 inches at 11 p.m. of Thursday; the lowest, 29.808 inches at 11.30 p.m. of Wednesday, when a strong westerly gale prevailed. The mean dry bulb temperature was 42.4° , or 2° above the average. The highest reading of the thermometer was 53.6° degrees on Wednesday; the lowest was 37.4° on Saturday. There were light showers on three days, but the only measurable rainfall was 0.29 inch on Wednesday. Some smoke fog, and haze were noticed on Saturday, on the evening of which day a total eclipse of the moon (magnitude, 1.642 lunar diameters) was seen under most favourable circumstances.

Sunday, the 29th, was the coldest day in the month—the thermometer falling to 25.9° in the screen, and to 19.4° on the grass, and rising in the daytime only to 37.4° . Slight snow and sleet or cold rain fell on the last two days—a severe northerly gale occurring on the 31st, when a well-marked depression travelled southwards across the whole of Great Britain.

At Greystones, Co. Wicklow, the rainfall in January amounted to 3.36 inches, distributed over only eight days. Of this quantity .57 inch was measured on the 1st, 1.66 inches on the 3rd, and .62 inch on the 4th—that is, no less than 3.05 inches on three days.

FEBRUARY.—Notwithstanding a spell of mild weather, which lasted from the 3rd to the 10th, February 1888 proved to be a very cold and snowy month. Even in Dublin snow or hail fell on as many as fourteen days, and the mean temperature was no less than 4.6° below the average, and 3.6° below that of the preceding month of January. The rainfall fell far short of the average, and consisted chiefly of melted snow and hail. The amount of cloud was very great—namely, 73.1 per cent. It is remarkable that during the mild, fine weather of the earlier part of the month the wind was generally north-westerly, an area of high atmospheric pressure lying off the S.W. of Ireland.

In Dublin the mean temperature (38.6°) was much below the average (43.2°); the mean dry bulb readings at 9 a.m. and 9 p.m. were 38.6° . In the twenty-three years ending with 1887, February was coldest in 1873 (M. T. = 37.9°) and warmest in 1869 (M. T. = 46.7°). In 1886, the M. T. was 39.7° ; in the year 1879 (the cold year) it was 40.1° . As a general rule, February in Dublin is only a shade colder than March. This is owing to the continued development in February of a winter area of low pressure over the Atlantic to the north-westward of the British Isles and to a resulting prevalence of S.W. winds in their vicinity, while the Continental anticyclone embraces the British Isles and Scandinavia in March, causing easterly winds and low temperatures. In 1888, however, the Continental anticyclone spread westwards across Scandinavia and the Norwegian Sea in the middle of February; hence the great cold of the latter half of the month.

The mean height of the barometer was 30.118 inches, or no less than 0.257 inch above the average value for February—namely, 29.862 inches. The mercury rose to 30.565 inches at 9 a.m. of the 28th, and fell to 29.461 inches at 9 p.m. of the 11th. The observed range of atmospheric pressure was, therefore, 1.107 inches—that is, a little over one inch and one-tenth. The mean temperature deduced from daily readings of the dry bulb thermometer at 9 a.m. and 9 p.m. was 35.0° , or 3.3° below the value for January, 1888; that calculated by Koenig's formula from the means of the daily maxima and minima was 37.9° , or 4.6° below the average mean temperature for February, calculated in the same way, in the twenty years, 1865–84, inclusive (42.5°). The arithmetical mean of the maximal and minimal readings was 38.6° , compared with a twenty years' average of 43.2° . On the 3rd the thermometer in the screen rose to 51.4° —wind W.S.W.; on the 14th the temperature fell to 24.8° —wind W.N.W. The minimum on the grass was 16.4° on the same date. The rainfall was only 1.097 inches, distributed over 14 days. The average rainfall for February in the twenty years, 1865–84, inclusive, was 2.244 inches, and the average number of rainy days was 17.6. The rainfall and the rainy days, therefore, were both very much below the average, although not to the same extent as in 1887, when only .541 inch of rain fell on 11 days. In 1883 the rainfall in February was large—3.752 inches on 17 days; in 1879 also 3.706 inches fell on 23 days. On the other hand, in 1875, only .925 of an inch was measured on but 8 days. The rainfall in 1887 was much the smallest recorded in February for very many years. Snow or sleet fell on the 2nd, 11th, 12th, 14th, 15th, 19th, 20th, 22nd, 24th, 25th, and 29th. Hail fell on the 1st, 10th, 19th, 20th, 21st, 22nd, 24th, 25th and 29th. The atmosphere was foggy on the 15th and 16th. High winds were noted on 11 days, reaching the force of a gale on only one day, the 2nd. The temperature exceeded 50° in the screen on only 4 days, compared with 10 days in January; while it fell to or below 32° in the screen on 12 days, compared with only 5 in January. The minima on the grass were 32° or less on 22 nights, compared with 17 nights in January. On 13 days the thermometer did not rise to 40° in the screen.

In the period ending Saturday, the 4th, the barometer was, after the 1st, high over Germany and France, low and unsteady over Scandinavia, where the dominant systems of atmospheric pressure were cyclonic.

On the 1st, the depression, mentioned in last month's abstract as having travelled across Great Britain in a southerly direction on January 31, was filling up quickly over France. At night a keen frost occurred in England, the thermometer falling to 16° at Cambridge and to 10° at Hillington and Goldstone. On the 2nd snow and sleet fell in Ireland, off the S.W. coast of which country an area of high pressure became established.

This anticyclonic system continued to lie over the Atlantic off the S.W. of Ireland until Friday, the 10th; so that throughout this period the wind was northwesterly in the British Islands—more westerly in the North, more northerly in the South. The weather, although cloudy, was fine and mild—the singularly warm N.W. current being a remarkable feature of the period. After Tuesday, the 7th, the barometer fell gradually, and by Saturday, the 11th, pressure had become low, while cold showers were prevalent with a much reduced temperature. Snow and hail fell generally on Friday and Saturday. In Dublin the mean pressure was 30.076 inches, the barometer falling from 30.382 inches at 9 a.m. and 9 p.m. of Monday to 29.451 inches at 9 p.m. of Saturday. The mean dry bulb temperature was 43.2° . On Sunday, the 5th, the thermometer rose to 50.8° , and on Saturday, the 11th, it fell to 31.3° . Rain fell on three days (including hail on one day and snow on one day)—the total measurement being $.040$ inch, of which $.015$ inch was registered on Friday and an equal quantity on Saturday.

The week ending Saturday, the 18th, was the coldest experienced in the present winter. The mean dry bulb temperature was 33.0° , or only one degree above freezing point. Temperature was highest (43.3°) on Friday, the 17th, lowest (24.6°) on Tuesday, the 14th, when the minimum sank to 16.4° on the grass. The mean temperature was 10.2° below that of the previous week, and 8° below the average for the time of year. Until Friday the thermometer never rose to 40° in the screen. The mean height of the barometer was 30.033 inches—the lowest pressure was 29.503 inches about 3 p.m. of Sunday, the highest was 30.393 inches at 9 a.m. of Thursday. A little snow fell on Sunday night and early on Tuesday and Wednesday. The only measurable precipitation was, however, $.002$ inch of rain on Saturday. The planet Mercury was clearly seen to W. by S. at 6.20 p.m. of Saturday, the 18th. The wind varied between W. and N., except on Monday, when it "boxed the compass" as a snowstorm depression passed eastwards south of Dublin. On the 16th the thermometer fell to 1° at Leirg, in Sutherland, 4° at Bracomar, and 5° at Brookeborough, Co. Fermanagh. On this day snow lay to the depth of 30 inches at Oxford.

The very wintry spell of weather which set in on Friday, February 10, persisted throughout the week ending Saturday, 25th. It is true that the minimal readings of the thermometer were not nearly so low in Dublin as they had been in the previous week—nevertheless, the weather was even more severe, for strong N.E. winds, piercing cold, and frequent heavy falls of snow and hail took the place of the dry and frosty weather of the preceding week. The barometer was high in the extreme north, low in the south (that is, over France, the Mediterranean, and Spain). Hence the strong E. and N.E. winds of the period. In Dublin the mean atmospheric pressure was 30.042 inches; highest, 30.231 inches at 9 a.m. of Friday; lowest, 29.802 inches at 9 a.m. of Sunday. The mean dry bulb temperature was 35.8° . Temperature was highest on Tuesday (41.0°), lowest on Sunday (31.3°). The rainfall amounted to $.796$ inch on six days. Of this quantity $.273$ inch was measured on Saturday. The precipitation was almost entirely in the form of snow and hail.

During the last four days fresh to strong northeasterly to easterly winds prevailed, accompanied by dull, bleak weather, and on the Dublin coast frequent showers of hail and snow. In the S.E. of England temperature was very low at this time, and dry snow fell at times.

At Greystones, Co. Wicklow, the rainfall in February was only 0.43 of an inch, distributed over 8 days. The maximal fall in 24 hours was 0.12 inch on the 21st.

MARCH.—The month was very cold, except for a brief period from the 6th to the 10th inclusive, and also on the 21st and 22nd. The precipitation, which was very large, was chiefly in the form of snow, or sleet and hail; and the winds, which were high and squally, came principally from polar points of the compass.

The cold was intense in Northern Europe (Russia, Finland, and Scandinavia) throughout the month, whereas it became much less intense than it had been in February in Central and Southern Europe. Indeed, during the last ten days there was a general thaw in France, Germany, and Austria.

In Dublin the mean temperature (39.8°) was decidedly below the average (43.5°); the mean dry bulb readings at 9 a.m. and 9 p.m. were 39.0° . In the twenty-three years ending with 1887, March was coldest in 1867 and 1883 (M. T. = 39.0°) and warmest in 1868 (M. T. = 47.3°). In 1876, the M. T. was 41.1° ; in the year 1879 (the cold year) it was 42.5° . As a general rule, February in Dublin is only a shade colder than March. This is due to the fact that the Continental anticyclone embraces the British Isles and Scandinavia in March, causing easterly winds. In the present year, February was only 1.2° colder than March, and the temperature even in January was actually 2.3° above that of the past month.

The mean height of the barometer was 29.646 inches, or as much as 0.277 inch below the average value for March—namely, 29.923 inches. The mercury rose to 30.481 inches at 9 a.m. of the 21st, and fell to 28.556 inches at 1 p.m. of the 28th. The observed range of atmospheric pressure was, therefore, as much as 1.925 inches—that is, a little less than two inches. The mean temperature deduced from daily readings of the dry bulb thermometer at 9 a.m. and 9 p.m. was 38.9° , or 0.9° above the value for February, 1889; that calculated by Kaemtz's formula from the means of the daily maxima and minima was also 38.9° , or 38° below the average mean temperature for March, calculated in the same way, in the twenty years, 1865–84, inclusive (42.7°). The arithmetical mean of the maximal and minimal readings was 39.3° , compared with a twenty years' average of 43.5° . On the 8th the thermometer

in the screen rose to 58°—wind S.W.; on the 17th the temperature fell to 36°—wind N.W. The minimum on the grass was 21·6° on the 5th. The rainfall was 3·753 inches, distributed over 18 days. The average rainfall for March in the twenty years, 1868-84, inclusive, was 2·081 inches, and the average number of rainy days was 16·5. The rainfall and the rainy days, therefore, were decidedly above the average. In 1867 the rainfall in March was very large—4·972 inches on 22 days; in 1866 also 3·629 inches fell on 21 days. On the other hand, in 1871, only 615 of an inch was measured on 12 days, and in 1874 only 953 inch fell, also on 12 days. In 1887, 1·485 inches of rain fell on 15 days.

Solar halos appeared on the 13th and 27th. The atmosphere was foggy on the 14th, 24th, and 25th. High winds were noted on 11 days, reaching the force of a gale on 5 days, the 7th, 8th, 9th, 13th, and the 28th. Snow or sleet occurred on the 11th, 12th, 13th, 15th, 16th, 18th, 19th, 25th, 26th, 27th, and 28th—ten days in all; and hail fell on the 1st, 12th, 13th, 15th, 16th, 19th, 24th, 25th, 26th, 27th, and 28th.

In the period ending Saturday, the 3rd, the barometer was high over Scotland and Ireland, low over Scandinavia and the Peninsula. The weather was, in consequence, cold, with Polar winds between N.E. and N.W.

In the course of the week ending Saturday, the 10th, the weather underwent a complete change in the British Islands, and indeed throughout the greater part of Western Europe. The piercing easterly winds of February gave place to warm, humid S.W. winds, which blew strongly after Tuesday and were accompanied by considerable falls of rain on Thursday and Friday. The increase of temperature extended to Central Europe, but severe frost held in Northern Russia and throughout Scandinavia. In Dublin, the mean height of the barometer was 29·581 inches; highest, 30·001 inches at 7 p.m. of Tuesday; lowest, 28·934 inches at 3·40 p.m. of Friday. The mean dry bulb temperature was 44·6°. The shade thermometer rose to 58·6° on Thursday, having fallen to 30·7° on Monday. Rain fell in measurable quantity on three days to the total amount of 2·41 inch, the maximum fall in 24 hours being 650 inch on Saturday, or rather in the early morning hours of Sunday, the 11th.

Very inclement weather prevailed throughout the week ending Saturday the 17th, owing to the advance outwards across the British Islands of a series of deep atmospheric depressions between two areas of high pressure, of which one lay over Scandinavia and the other over the Iberian Peninsula. Intense cold held in Northern Europe, but in France and the southern portion of the United Kingdom temperature was occasionally high. In Dublin, the mean dry bulb temperature was 30·5°, or 3·1° below that of the previous week. The absolute maximum, 48·7°, really occurred at 9 p.m. of Saturday, the 10th, and subsequently the thermometer did not rise above 43·4°. The minimum in the screen was 20·4° on Saturday, the 17th, when the minimum on the grass was 22·0°. The barometer ranged between 29·935 inches at 9 a.m. of Sunday, and 30·214 inches at 9 p.m. of Saturday—the mean pressure being 29·434 inches. The precipitation, which was chiefly in the form of snow or sleet and hail, amounted to 1·030 inches on five days. On Sunday the rainfall measured 1·012 inches, and on Tuesday 600 inch fell. Snow lay deep upon the Dublin mountains from Sunday afternoon.

The beginning and the end of the third week (18th to 24th inclusive) were cold, with a singularly keen and nipping air. A short-lived mild spell set in on Wednesday afternoon and lasted till Thursday evening. During the first three days the barometer was high in the North and Northwest, so that E. to N.E. winds prevailed, with occasional showers of hail and snow. On Wednesday pressure gave way in the North, and S.W. winds with warm sunshine were experienced, followed by clouds and soft rain. From Thursday both pressure and temperature were low, and the wind was light and variable, chiefly from polar points of the compass. In Dublin, the mean height of the barometer was 30·031 inches—the extremes being—highest, 30·451 inches at 9 a.m. of Wednesday; lowest, 29·980 inches at 9 p.m. of Saturday. The mean dry bulb temperature was 37·7°. The thermometers in the screen rose to 53·1° on Thursday and fell to 29·7° on Saturday. The minima in the screen were below 32° on five nights. The rainfall amounted to 200 inch, distributed over four days. Of the total quantity, 100 inch was measured on Wednesday. Snow or hail fell on the first two days of the period, and large hail late on Saturday night.

The record of the last week (25th to 31st inclusive) is again one of wintry weather, but towards the close of the period signs were not wanting of a coming change to milder and more spring-like conditions. Until Saturday, the 31st, atmospheric pressure was unusually low over the British Islands, a series of deep depressions culminating on Wednesday, the 28th, in a cyclone, near the centre of which the barometer receded to 28·39 inches at Scilly. This system subsequently filled up by degrees as it travelled slowly in an easterly direction towards the North Sea and the Continent. On the first three days of the week showers of snow, hail, and soft hail (grape) fell at intervals. On Wednesday, the 28th, a fresh easterly gale prevailed, with heavy rain, hail, and wet snow. Two rather dull damp days followed, but the last day of the month proved fine and bright. In Dublin, the mean pressure was only 29·185 inches—highest, 30·033 inches at 9 p.m. of Saturday; lowest, 28·556 inches at 1 p.m. of Wednesday. The mean dry bulb temperature was 37·6°—max., 48·6° on Thursday; min., 27·9° on Monday. The rainfall measured 632 inch on six days. Of this quantity 320 inch was registered on Wednesday. A solar halo appeared on Tuesday.

In Dublin, the temperature fell to or below 32° on eleven days in the screen, and on twenty-six days on the grass. The mean minimal temperature on the grass was 28·7°, compared with 29·4° in February and 31·1° in January. In Dublin, the rainfall for the first quarter of 1888 amounted to 8·097 inches on 41 days, compared with 3·842 inches on 42 days in the corresponding quarter of 1887.

At Greystones, Co. Wicklow, the rainfall in March, 1888, amounted to 3·45 inches, distributed over 14 days. Of this quantity 92 inch was measured on the 10th, 1·18 inches on the 11th, and 28 inch on the 27th—that is, no less than 2·38 inches on three days.

April.—A generally cold, cloudy, changeable, showery month, with average atmospheric pressure, and a preponderance of winds from polar points of the compass. In Dublin rain fell on as many as seventeen days, but the total amount was only about two inches. With the exception of 1870 and 1887, this was the coldest April experienced in Dublin since the present records were commenced in 1860.

In Dublin the mean temperature (45.7°) was decidedly below the average (47.6°); the mean dry bulb readings at 9 a.m. and 9 p.m. were 45.2° . In the twenty-three years ending with 1887, April was coldest in 1879 (the cold year) (M. T. = 44.5°), and warmest in 1865 and 1874 (M. T. = 50.3°). In 1886, the M. T. was 46.3° and in 1887 it was as low as 45.1° .

The mean height of the barometer was 29.920 inches, or 0.063 inch above the average value for April—namely, 29.857 inches. The mercury rose to 30.350 inches at 9 a.m. of the 6th, and at 9 a.m. of the 26th, and fell to 29.137 inches at 9 p.m. of the 30th. The observed range of atmospheric pressure was, therefore, 1.213 inches—that is, a little less than one inch and a quarter. The mean temperature deduced from daily readings of the dry bulb thermometer at 9 a.m. and 9 p.m. was 45.2° , or 6.5° above the value for March, 1888; that calculated by Kæmpe's formula from the means of the daily maxima and minima was 44.7° , or 2.3° below the average mean temperature for April, calculated in the same way, in the twenty years, 1865–84, inclusive (47.0°). The arithmetical mean of the maximal and minimal readings was 45.7° , compared with a twenty-three years' (1865–1887 inclusive) average of 47.8° . On the 14th the thermometer in the screen rose to 60.6° —wind S.; on the 9th the temperature fell to 28.6° —wind N.W. The minimum on the grass was 32.0° on the same date. The rainfall was 1.993 inches, distributed over 17 days. The average rainfall for April in the twenty-three years, 1865–87, inclusive, was 2.034 inches, and the average number of rainy days was 14.8. The rainfall, therefore, was perceptibly below the average, while the rainy days exceeded it. In 1877 the rainfall in April was very large—4.707 inches on 31 days; in 1882 also 3.536 inches fell on 20 days. On the other hand, in 1873, only .498 of an inch was measured on 5 days, and in 1870 only .338 inch fell, also on 5 days.

Solar halos were seen on the 9th, 28th, and 29th. The atmosphere was more or less foggy on the 5th and 6th. High winds were noted on no fewer than 15 days, but on only one occasion was the force of a gale attained—namely, on the 30th. Snow or sleet occurred on the 4th and 8th; and hail fell on the 3rd, 4th, 18th, 19th, and 22nd.

During the week ending Saturday, the 7th, the promise of finer weather observed towards the close of the previous month was in part fulfilled, for although the mean temperature was again much below the average for the time of year, the cold winds moderated and some warm sunshine was enjoyed, particularly at the beginning and end of the week. An anticyclone, or area of high atmospheric pressure, prevailed off the West of Ireland, while several depressions of no great depth travelled southwards down the east coast of Great Britain, producing cold showers at intervals. In Dublin cold rain, sleet, and hail fell on Wednesday, the 4th. The mean atmospheric pressure for the week was 29.132 inches, or as much as 0.954 inch above that for the previous week. The barometer fell to 29.648 inches at 9 a.m. of Wednesday, and rose to 30.350 inches at 9 p.m. of Friday. The mean dry bulb temperature was 40.6° —maximum, 51.6° on Monday; minimum, 32.6° on Sunday. Rain fell on 4 days to the amount of .232 inch, the heaviest rainfall in twenty-four hours being .139 inch on Tuesday.

A very decided change in the weather occurred early in the second week (8th to 14th inclusive)—low temperature and biting winds gave way to spring-like warmth and soft, damp Atlantic or equatorial winds, with genial rains. Sunday, the 8th, indeed, was very cold—the day was ushered in with a fall of cold rain and sleet and closed with a sharp frost. A solar halo, which developed in a thin film of cirro-stratus cloud on Monday forenoon, was the harbinger of a warm air current, which persisted throughout the remainder of the period—the warmth culminating on Saturday, when the thermometer rose to 60.6° in the screen. This was the first occasion in the present season upon which the temperature exceeded 60° in the shade. In Dublin the mean height of the barometer was 29.071 inches—the extremes being, highest, 30.184 inches, at 9 a.m. of Tuesday; lowest, 29.744 inches, at 9 p.m. on Thursday. The mean dry bulb temperature was 46.9° , or 6.3° above that of the previous week (40.6°). The thermometer rose to 60.6° on Saturday, having fallen to 28.8° on Monday. Rain fell in measurable amount on four days—the total precipitation being .487 inch, and the maximal fall in 24 hours being .294 inch on Wednesday. The prevalent directions of the wind were N.W. and W.

In the third week (15th to 21st inclusive) the weather was at first fine and springlike, but from Tuesday it was very unsettled and showery or rainy. The type of atmospheric pressure was throughout cyclonic in the British Islands. Until Thursday morning the area of lowest barometer was found permanently off the north-west of Ireland, so that the prevailing winds were S. to S.W. and W. During Thursday and Friday the low pressure system travelled slowly south-eastwards across Great Britain, and in consequence the wind drew into N. and N.E. in Ireland, with a decided fall of temperature, much cloud, rain, and gloom. On Wednesday and Thursday sharp thunder and hailstorms occurred in many parts of the United Kingdom. In Dublin the mean dry bulb temperature was 47.3° ; the thermometer rose to 59.4° on Monday and fell to 39.2° on Saturday. The mean height of the barometer was 29.646 inches—the lowest pressure observed being 29.416 inches at 9 a.m. of Wednesday, and the highest being 29.867 inches at 9 a.m. of Saturday. The prevailing winds were at first S.W. and afterwards N.W. to N.E. Rains fell on five days to the amount of .670 inch; the maximal fall in 24 hours was .224 inch on Wednesday. Hail fell on Wednesday and Thursday.

In the fourth week (22nd to 28th inclusive) keen north-easterly winds, low temperature, and cloudy but dry weather prevailed until Friday, when a mild westerly current spread over the country, and some soft rain fell. Saturday was very mild and fine—the S.W. current being fully estab-

lished. In the east and south-east of England, rain fell heavily during the prevalence of the N.E. winds, but in Ireland the weather was dry for the most part. In Dublin the barometer was low both at the beginning (29.795 inches) and close (29.747 inches) of the week; but at 9 a.m. of Thursday it read as high as 30.350 inches. The mean atmospheric pressure was 30.039 inches. The mean dry bulb temperature, deduced from daily observations at 9 a.m. and 9 p.m., was 45.5°. The thermometer in the screen rose to 58.4° on Saturday, having fallen to 39.4° on Thursday. Rain fell on two days to the amount of .131 inch. Of this quantity, .060 inch was measured on Friday, and .071 inch on Saturday. A little hail fell early on Sunday morning. A perihelion was seen at 5.30 p.m. on Saturday.

The last two days were changeable, and the month closed with a fresh southerly gale, and heavy rain, as a deep V-shaped depression advanced over the British Islands from the south-westward.

In Dublin, the temperature fell to or below 32° on only one day in the screen, but on eleven days on the grass. The mean minimal temperature on the grass was 34.6°, compared with 28.7° in March, 29.4° in February, 31.1° in January. In April, 1887, the mean minimal temperature on the grass was 31.6°.

The rainfall in Dublin during the four months ending April 30th amounted to 8.090 inches on 58 days, compared with 5.007 inches on 52 days during the same period in 1887, and a twenty-three years' average of 8.488 inches, on 60.3 days.

At Greystones, Co. Wicklow, the rainfall in April, 1888, was 1.40 inches, distributed over only 9 days. Of this quantity, .51 inch fell on the 29th, .30 inch on the 17th, and .24 inch on the 3rd. From January 1 to the end of April, 8.59 inches of rain fell at Greystones, on, however, only 39 days.

MAY.—Very stormy, rough, and unsettled both at the beginning and at the end, May, 1888, was nevertheless, a bright, dry, pleasant month. The rainfall was scanty, and in an anticyclonic period lasting from the 29th to the 30th, the sky was for the most part cloudless. As in May, 1887, there was a preponderance of polar winds (N.W. to N.E. and E.). The gales of the 1st, 2nd, 3rd, 30th and 31st were very severe for the season. Thunder was heard on the 2nd, and hail fell on that and the following day.

In Dublin the mean temperature (52.5°) was slightly above the average (51.9°); the mean dry bulb readings at 9 a.m. and 9 p.m. were 52.4°. In the twenty-three years ending with 1887, May was coldest in 1869 (M. T. = 48.2°), in 1883 (M. T. = 48.7°), and in 1879 (the cold year) (M. T. = 48.6°). It was warmest in 1868 (the "warm year") (M. T. = 55.6°) and 1875 (M. T. = 54.9°). In 1886 the M. T. was 50.5°, and in 1887 it was 51.8°.

The mean height of the barometer was exactly 30.000 inches, or 0.004 inch above the average value for May—namely 29.996 inches. The mercury rose to 30.313 inches at 9 a.m. of the 11th and 23rd, and fell to 29.990 inches at 8 a.m. of the 1st. The observed range of atmospheric pressure was, therefore, as much as 1.523 inches—that is, a little more than one inch and a half. The mean temperature deduced from daily readings of the dry bulb thermometer at 9 a.m. and 9 p.m. was 52.4°, or 7.2° above the value for April, 1888; that calculated by Kaemle's formula from the means of the daily maxima and minima was 51.2°, or 0.3° above the average mean temperature for May, calculated in the same way, in the twenty years, 1865–84, inclusive (50.9°). The arithmetical mean of the maximal and minimal readings was 52.5°, compared with a twenty-three years' average of 51.9°. On the 7th the thermometer in the screen rose to 68.7°—wind W. S. W.; on the 14th the temperature fell to 36.0°—wind W.N.W. The minimum on the grass was 28.1° on the latter date. The rainfall was only .076 of an inch, distributed over 11 days. The average rainfall for May in the twenty-three years, 1865–87, inclusive, was 2.072 inches, and the average number of rainy days was 15.5. The rainfall and the rainy days, therefore, were decidedly below the average. In 1886 the rainfall in May was very large—6.478 inches on 21 days; in 1869 also 5.414 inches fell on 19 days. On the other hand, in 1871, only .378 of an inch was measured on nine days; in 1876 only .796 of an inch fell on six days; and in 1887 only .882 of an inch fell on 10 days.

There was a solar halo on the 15th. The atmosphere was foggy on the 10th, 11th, and early morning of the 27th. High winds were noted on eight days, attaining the force of a gale on the 1st, 2nd, 3rd, 30th, and 31st. Hail occurred on the 2nd and 3rd. The only heavy falls of rain were on the 9th (.235 inch), in connection with an anticyclone, and on the 29th (.261 inch), in connection with a deep depression and gale.

During the week ending Saturday, the 5th, the weather was chiefly rough, cold, and showery—a series of deep depressions in the North-west and North causing fresh or strong gales at first from S., and afterwards from W. or N.W. Many years have passed since May was ushered in by such stormy weather as prevailed on the present occasion—the wind reaching the force of a gale on each of the first three days of the month. Hail fell in heavy showers on Wednesday and Thursday, the 2nd and 3rd, and thunder occurred at 1 p.m. of the former day. In Dublin the mean height of the barometer was 29.706 inches—the extremes being—highest, 30.246 inches, at 9 a.m. of Friday; lowest, 29.600 inches, at 8 a.m. of Tuesday. The mean dry bulb temperature at 9 a.m. and 9 p.m. was 47.6°. On Saturday the thermometer in the screen rose to 57.0°, having fallen to 36.0° on the previous day, when a minimal reading of 28.1° was recorded on the grass. Rain fell in appreciable quantity on five days (including hail on two days), the total measurement being 7.46 inch, of which, however, .845 inch fell on Monday, April 30th, and .110 inch on Sunday, April 29th.

In the second week (from the 6th to the 12th inclusive) the weather was favourable, except on Wednesday, which was a dull, cold, and ultimately wet day. At the beginning of the period, moderate westerly winds prevailed, with a good deal of cloud and high temperature. On Tuesday evening the wind drew into N., and the thermometer gave way. On Wednesday the clouds came from

N.W., while a cold easterly breeze caused a considerable rainfall (238 inch in Dublin). Next morning the clouds dispersed, and the remainder of the week was fair and quiet—cool easterly sea breezes by day being followed by calms and low temperatures by night. In Dublin the mean height of the barometer, was 30.330 inches—the highest reading being 30.519 inches at 9 a.m. of Friday; the lowest, 30.144 inches, at 9 p.m. of Monday. The mean dry bulb temperature at 9 a.m. and 9 p.m. was 51.8°. On Monday the shade thermometer rose to 68.7°—the maximum for the month—while it fell to 38.9° on Friday. There were frosts on the grass on the last two mornings. The rainfall for the week was 233 inch, recorded on Wednesday, the 9th.

At the beginning of the third week (13th–19th inclusive) conditions were anticyclonic and the weather was fine and dry. On Monday, the 14th, the barometer gave way quickly, and the wind backed to S.W. and S. from N.W., with showers and squalls and very unsteady temperature. On Friday, the 18th, the isobars ran nearly due N. and S. across Western Europe, and very warm weather was experienced except at the sea coast stations—the thermometer rose to 75° in the shade in London. On the previous day it had reached 82° degrees at Berlin and Belfort, and 79° at Wiesbaden and Biarritz. In Dublin the mean dry bulb temperature, deduced from observations taken daily at 9 a.m. and 9 p.m., was 51.5°. The highest reading of the thermometer was 65.5° on Saturday, the lowest was 39.2° on Monday. The mean atmospheric pressure was 29.633 inches. At 9 a.m. of Sunday the barometer was as high as 30.320 inches; at 9 p.m. of Wednesday it fell to 29.183 inches. Rain fell in appreciable amount on four days—the total precipitation being 151 inch, of which .666 inch was measured on Wednesday, the 16th.

Settled, brilliant weather characterized the week ending Saturday, the 26th, in Ireland, where conditions were for the most part anticyclonic. On Sunday an irregular atmospheric depression, which had caused severe thunderstorms in parts of Great Britain—especially in the S.W. of Scotland—on the previous day, was disposing off the N. of Scotland, and a high pressure system was advancing northwards over the United Kingdom from France. This system subsequently took up a fixed position in the N. and N.W., and in consequence the wind became north-easterly. In Ireland it blew with little force, and a cloudless sky prevailed day after day. In Great Britain the wind was stronger, and clouds shut out the sun's rays, so that temperature was often low. In Dublin the mean height of the barometer was 30.333 inches, pressure increasing from 30.034 inches at 9 a.m. of Sunday to 30.519 inches at 9 a.m. of Wednesday, and afterwards decreasing to a minimum for the week of 29.984 inches at 9 p.m. of Saturday. The mean dry bulb temperature, deduced from observations taken daily at 9 a.m. and 9 p.m., was 57.1°, an advance of 5.6° degrees upon the corresponding temperature of the previous week. The thermometer rose to 60.3° in the screen on Sunday, and fell to 45.3° on Saturday. No rain fell in Dublin during the period. At the Ordnance Survey Office, Phoenix Park, no less than 95.6 hours of bright sunshine were registered this week, or a daily average of 13.7 hours.

On Sunday, the 27th, the anticyclone in the N. and N.W. completely dispersed, and conditions became less settled. On Monday night a sharp frost took place in Scotland, the shade thermometer falling to 25° at Wick and to 30° at Nairn. Next day a large and deep impression came in over the N.W. of Ireland from the Atlantic, causing strong S. to W. gales and a heavy and general rainfall throughout the Kingdom. At Donaghadee 1.84 inches of rain fell in the 24 hours ending 8 a.m. of Wednesday, the 30th. In Dublin the last three days of the month were rough, cold, and unsettled.

During the month the thermometer in the screen did not fall below 36.5° (on the 4th), but on seven nights temperature of 32° or less were recorded on the grass. The mean minimal temperature on the grass was 37.5°, compared with 34.6° in April, 28.7° in March, 29.4° in February, and 31.1° in January. In May, 1887, ground frosts were observed also on seven nights, and the mean minimal temperature on the grass was 37.9°.

The rainfall in Dublin during the five months ending May 31st amounted to 9.668 inches on 69 days, compared with 6.480 on 62 days during the same period in 1887, and a twenty-three years' average of 10.560 inches, on 81.7 days.

At Greystones, County Wicklow, the rainfall in May, 1888, was 2.14 inches, distributed over only nine days. Of this quantity, 1.43 inches fell on the 29th, .34 inch on the 1st, and .27 inch on the 9th. From January 1 to the end of May, 10.73 inches of rain fell at Greystones, or, however, only 48 days.

JUNE.—This month shows a marked contrast to June, 1887, which will be long remembered as one of the driest and warmest months on record in Dublin. The mean temperature fell 6.1° short of that of June, 1887; the mean height of the barometer was .278 inch lower; and more than ten times as much rain fell, on eighteen as compared with five days. The only meteorological factor which corresponded in the two years was the direction of the wind. In the past month, as in June, 1887, there was a singular preponderance of polar (N., N.E., and E.) winds. Were it not for a bright period in the third week, the month would have been a singularly cheerless one.

In Dublin the mean temperature (56.2°) was decidedly below the average (57.8°); the mean dry bulb readings at 9 a.m. and 9 p.m. were 56.1°. In the twenty-three years ending with 1887, June was coldest in 1882 (M. T. = 55.8°), and in 1879 (the "cold year") (M. T. = 55.9°). It was warmest in 1887 (M. T. = 62.5°), in 1865 (M. T. = 61.0°), and in 1868 (the "warm year") (M. T. = 60.3°). In 1886, the M. T. was 57.5°.

The mean height of the barometer was 29.935 inches, or a shade (.011 inch) above the average value for June—namely, 29.924 inches. The mercury marked 30.300 inches at 9 p.m. of the 18th, and fell to 29.443 inches at 9 a.m. of the 12th. The observed range of atmospheric pressure was, therefore, .857 inch—that is, a little less than nine-tenths of an inch. The mean temperature deduced from daily readings of the dry bulb thermometer at 9 a.m. and 9 p.m. was 56.1°, or 3.7 above the value for May, 1888; that calculated by Kaemtz's formula from the means of the daily maxima

and minima was 55.1°, or 1.3° below the average mean temperature for June, calculated in the same way, in the twenty years, 1865-84, inclusive (56.4°). The arithmetical mean of the maximal and minimal readings was 56.2°, compared with a twenty-three years' average of 57.8°. On the 20th the thermometer in the screen rose to 72.4°—wind S.S.E.; on the 14th the temperature fell to 43.2°—wind N.W. The minimum on the grass was 30.9° on the latter date. The rainfall was as much as 3.045 inches, distributed over eighteen days. The average rainfall for June in the twenty-three years, 1865-87, inclusive, was 1.830 inches, and the average number of rainy days was 14.6. The rainfall and the rainy days, therefore, were decidedly above the average. In 1878 the rainfall in June was very large—6.058 inches on nineteen days; in 1879 also 4.046 inches fell on 24 days. On the other hand, in 1874, only .405 of an inch was measured on nine days, and in 1868 only .677 of an inch fell on but six days. In 1887, the rainfall was only .252 of an inch, distributed over only five days.

There was a solar halo on the 20th. The atmosphere was foggy on the 2nd. High winds were noted on five days, but did not attain the force of a gale on any occasion. Temperature reached or exceeded 70° in the screen on only one day, as compared with 17 days in 1887. Luminous dirt were seen from Dublin on the northern horizon on the nights of the 15th and 20th. There was a thunderstorm on the evening of the 2nd, and heavy thunder showers occurred on the 12th and 18th.

The first two days of the month were chiefly dull and very cold for the time of year. On the afternoon of Saturday, June 2, however, temperature rose quickly, and in the evening a thunderstorm occurred.

The week ended Saturday, the 9th, may be described as a dull, cold rainy period. On Sunday, a thunderstorm depression was passing away to the northward, and a cloudy forenoon was followed by a fine warm afternoon. During the remainder of the week Ireland was under the influence of an irregular depression, which advanced slowly from the Peninsula and the Bay of Biscay. It caused frequent and heavy rains, and squally southerly (S.E. to S.W.) winds. On Friday the wind shifted to the northward in the extreme west of Ireland, and the change spread slowly thence over the whole country, but without much improvement in the weather, which remained broken to the end of the week. In Dublin the mean height of the barometer was 29.837 inches—pressure was greatest, 30.149 inches, at 9 p.m. of Monday; least, 29.541 inches, at 9 a.m. of Friday. The mean dry bulb temperature, from observations taken daily, at 9 a.m. and 9 p.m., was 53.2°. On Sunday the thermometers in the screen rose to 66.7°; on Wednesday they fell to 45.6°. Rain fell on six days to the amount of 1.154 inches—of this quantity .505 of an inch was measured on Tuesday. On Sunday, the distribution of temperature in Great Britain was remarkable—in the S.E. of England the thermometer rose to 82° or 84°; at Stornoway and Aberdeen it did not exceed 40°, and heavy snow fell in central Scotland. In Paris, on this day, a maximum of 94° F. was reported.

In the period from the 10th to the 16th inclusive, cool, changeable weather again prevailed. It was fine at the beginning and end of the week, but on Monday and the two following days rain or thunder showers occurred, and again early on Friday morning there was a considerable fall of rain. Thunder was heard in different directions on the afternoons of Tuesday and Wednesday, and heavy showers fell in places. Late on Friday evening the sky cleared quickly, and luminous cirriform clouds were seen at 11 p.m. on the northern horizon. This phenomenon seems to be peculiar to the northern twilight of June and July. In Dublin the mean height of the barometer was 29.873 inches—pressure was greatest, 30.118 inches, at 9 p.m. of Saturday; least, 29.443 inches, at 9 a.m. of Tuesday. The mean dry bulb temperature, from observations taken daily at 9 a.m. and 9 p.m., was 55.6°. On Friday the thermometers in the screen rose to 63.9°; on Thursday they fell to 49.2°. Rain fell on four days to the amount of .464 of an inch—of this quantity, .210 of an inch was measured on Thursday. A decided north-easterly current prevailed at the end of the week.

During the week ended Saturday, the 13th, the weather, which was chiefly fine, dry, and bright in Scotland and Ireland, was for the most part unsettled, dull, cold, and showery, with thunderstorms, in England, Germany, and France. Throughout, a north-easterly (E. to N.) wind prevailed in Ireland, and until Wednesday only a few specks of cloud were seen in Dublin, whereas in London during the same time a dense cloud-canopy shut out the sun's rays so completely that temperature never rose above 53°. On Wednesday afternoon the sky towards E. assumed an unsettled appearance, and in the evening showers fell. At 8 a.m. on Thursday also there was heavy rain for a while. Two heavy, dull days followed, but Saturday was brilliant and warm. In Dublin the mean atmospheric pressure was 30.128 inches—the barometer ranging only from 30.300 inches at 9 p.m. of Monday to 30.086 inches at 9 p.m. of Wednesday. The mean dry bulb temperature, deduced from observations taken daily at 9 a.m. and 9 p.m., was 57.5°—the highest yet reached this season. The extreme temperatures were both recorded on Sunday, namely, 69.5° and 44.8°. On the morning of this day the grass minimum was 37.9°. Rain fell in measurable quantity on Wednesday only—amount, .089 inch.

During the week ended Saturday, 30th June, the weather fell into an unsettled, thundery condition, owing to the gradual advance from the southward of an irregular area of low atmospheric pressure, with several subsidiary thunderstorm depressions of small size. In Dublin the weather remained chiefly fine until Wednesday, and Tuesday was particularly bright and warm—the thermometer rising to 72.4° in the screen, the highest temperature recorded this season so far. In many parts of the United Kingdom, however, thunderstorms occurred almost daily after Sunday evening. On Monday and Tuesday great heat prevailed in England, the thermometer reaching 88° at Cambridge, 85° in London, 84° at Loughborough, and 82° at York, Barrow-in-Furness, and Liverpool on the former day. On Tuesday the maxima were found further north—namely, 85° at York, 84° at Loughborough, and at Nairn (in Scotland), and 82° at Barrow-in-Furness. Next day heavy rain fell in Dublin (.951 of an inch), and there was great gloom. Two dull, rainy days followed, but Saturday was fair and bright. In Dublin the mean height of the barometer was 29.797 inches, pressure ranging between 30.125 inches at 9 a.m. of Sunday, and 29.547 inches at 9 a.m. of Friday. The mean temperature deduced from readings of the dry bulb thermometer, taken daily at 9 a.m. and 9 p.m., was

58.5°, the extreme temperatures being—highest, 72.4°, on Tuesday; lowest, 46.5°, on Saturday. Rain fell on five days to the amount of 1.248 inches. Of this large quantity, .251 of an inch was credited to Wednesday.

The rainfall in Dublin during the six months ending June 30th amounted to 12.113 inches on 87 days, compared with 6.741 inches on 67 days during the same period in 1887, and a twenty-three years' average of 12.899 inches, on 93.7 days.

At Greystones, County Wicklow, the rainfall in June, 1888, was 4.18 inches, distributed over 15 days. Of this quantity, .96 inch fell on the 5th, .89 inch on the 11th, .79 inch on the 27th, and .07 inch on the 7th. From January 1 to the end of June, 14.91 inches of rain fell at Greystones, on, however, only 63 days.

JULY.—A wet, cloudy, odd month—almost as wet and cold as July, 1879, with which phenomenal month that now under review had many features in common. It is to be noted that, whereas July of 1887 was odd and wet in Scandinavia, very fine and hot in the British Isles and Central Europe, just the reverse held good as regards July, 1888, which was favourable in Northern Europe. The odd weather of the 10th and 11th was, perhaps, without a parallel.

In Dublin the mean temperature (57.3°) was much below the average (60.8°); the mean dry bulb readings at 9 a.m. and 9 p.m. were 56.6°. In the twenty-three years ending with 1887, July was coldest in 1870 (the "cold year") (M. T. = 57.5°). It was warmest in 1867 (M. T. = 63.7°), and in 1868 (the "warm year") (M. T. = 63.3°). In 1886, the M. T. was 61.0°. From this, 1887 proves to have been the warmest since the present records commenced, whilst July, 1888, was almost the coldest.

The mean height of the barometer was 29.747 inches, or 0.175 inch below the average value for July—namely, 29.922 inches. The mercury marked 30.178 inches at 9 a.m. of the 12th, and fell to 29.500 inches at 7 p.m. of the 2nd. The observed range of atmospheric pressure was, therefore, 0.678 inch—that is—a little less than an inch. The mean temperature deduced from daily readings of the dry bulb thermometer at 9 a.m. and 9 p.m. was 56.6°, or 0.6° above the value for June, 1888; that calculated by Kaemts's formula from the means of the daily maxima and minima was 56.3°, or .3° below the average mean temperature for July, calculated in the same way, in the twenty years, 1868–84, inclusive (56.6°). The arithmetical mean of the maximal and minimal readings was 57.5°, compared with a twenty-three years average of 60.8°. On the 21st the thermometer in the screen rose to 68.7°—wind S.W.; on the 11th the temperature fell to 42.6°—wind N.N.W. The minimum on the grass was 36.4° on the latter date. The rainfall was as much as 3.681 inches, distributed over 22 days. The average rainfall for July in the twenty-three years, 1866–87, inclusive, was 3.350 inches, and the average number of rainy days was 17.1. The rainfall and the rainy days, therefore, were decidedly above the average. In 1880, the rainfall in July was very large—6.467 inches on 24 days; in 1871 also 4.301 inches fell on 28 days. On the other hand, in 1870, only .539 of an inch was measured on 8 days; in 1869 the fall was only .730 of an inch on 9 days, and in 1868 only .741 of an inch fell on but 5 days.

A solar halo appeared on the 1st. High winds were noted on 8 days, but attained the force of a gale on only one occasion—viz, the 2nd. In July, 1887, temperature reached or exceeded 70° in the screen on no fewer than 17 days. In July, 1888, the maximum was 68.7°. There was a storm of thunder, lightning, and heavy rain on the 31st. Thunder was heard on the 4th, and lightning was seen on the evening of the 10th.

Although the month opened with a fair promise, the weather soon fell into a changeable, rainy and stormy condition. This lasted for several days, but from Thursday, the 5th, cool N.E. winds and finer weather prevailed in Scotland and Ireland, while it remained dull and cold in England. On the forenoon of Sunday, the 1st, long sprays of cirrus cloud, in which a solar halo appeared, crossed the sky in rapid motion from N.W. to S.E. As the day wore on, cloud increased and in the evening rain fell. Monday was wet, and a fresh W. gale sprang up in the evening. The next two days were showery. Thunder was heard on Wednesday forenoon, and the same evening luminous cirriform clouds showed on the Northern horizon. Thursday was fine in Ireland, thundery in England. At night a sea fog came in along the Dublin and Wicklow coasts. During the last two days of the week a cool N.E. wind, and dry, sometimes bright, weather prevailed. In Dublin the mean height of the barometer was 29.664 inches—pressure ranging between 29.200 inches at 7 p.m. of Monday, and 30.080 inches at 9 a.m. of Saturday. The mean temperature, deduced from readings of the dry bulb thermometer, taken daily at 9 a.m. and 9 p.m., was 56.5°, or 4° degrees below the average for the time of year. The highest shade temperature was 67.9° on Monday; the lowest was 40.5° on Sunday. Rain fell on four days to the amount of 1.068 inches, of which .403 inches was registered on Sunday night.

The second week (8th–14th) was memorable for a "cold spell," which is, perhaps, without a parallel in July. It occurred in connection with a complex system of low atmospheric pressure which travelled slowly from the North of Scotland to the Hebrides between Monday and Friday. In connection with this system, a subsidiary depression travelled quickly from N.N.W. to S.E. across Great Britain on Tuesday and Wednesday, causing equally N.W. to N. winds and heavy falls of cold rain, hail, and even snow. At 8 a.m. of Wednesday the thermometer stood at 44° in London, and the highest temperature there during the day was 53°. In Dublin, heavy cold showers fell on Tuesday evening, and at 9 p.m. the temperature was only 46.1°. From Thursday the air was warmer, but conditions were at no time settled during the week. In Dublin the mean height of the barometer was 30.047 inches, pressure ranging between 30.178 inches at 9 p.m. of Thursday and 29.693 inches at 9 a.m. of Monday. The mean dry bulb temperature, from observations taken at 9 a.m. and 9 p.m. daily, was 56.9°. On Friday the thermometer in the screen rose to 68.4°, on Wednesday it fell to 42.6°. Rain was registered on two days, the total quantity being .062 inch, of which .040 inch was measured on Tuesday. Hail and lightning were observed near Dublin on Tuesday evening.

For the third week (ending Saturday, the 21st) the record is again one of changeable, cloudy weather, occasional heavy rainfalls, and low temperatures for the season. In England the rain was often accompanied with thunder and lightning. The broken weather, as in previous weeks, extended to France and Central Europe generally; but it is worthy of note that in Scandinavia clear skies and high temperatures prevailed day after day, and the weather was almost rainless. During the week the barometer was lowest, in a series of irregular atmospheric depressions over the United Kingdom, France, and Germany—it was relatively high both in the extreme north of Europe and over the Iberian Peninsula in the south. In Dublin the mean height of the barometer was 29.706 inches—pressure ranging from 29.442 inches at 3.30 p.m. of Monday to 29.882 inches at 9 a.m. of Thursday. The mean dry bulb temperature deduced from daily readings at 9 a.m. and 9 p.m. was 57.7°. Temperature in the screen rose to 68.7° on Saturday and fell to 52.8° on Sunday. The rainfall amounted to .912 inch, distributed over six days. Of this quantity .329 inch fell on Thursday.

Very broken, wet, cold weather again prevailed throughout the fourth week (22nd–28th). Rain fell on every day, and as a rule the sky was densely clouded, shutting out all solar heat. Atmospheric conditions in the United Kingdom remained cyclonic. The barometer was generally lowest off the W. and N. coasts of Ireland, but on Wednesday and again on Friday the centres of well-formed depressions passed in a northeasterly direction across the S.E. of this country. These systems caused temporary N.E. winds while they were passing, but S. to W. and N.W. winds prevailed for the most part. In England and the north of Ireland thunderstorms occurred at times. In Dublin the mean height of the barometer was only 29.570 inches—pressure ranging from 29.392 inches at 4 p.m. of Monday to 29.810 inches at 9 p.m. of Saturday. The mean dry bulb temperature, deduced from daily readings at 9 a.m. and 9 p.m., was only 56.3°. Temperature in the screen rose to 66.7° on Tuesday and fell to 40.5° on Friday. Rain fell on every day during the week—the total quantity being 1.347 inches, of which .609 inch was measured on Friday and .364 inch on Tuesday.

The weather remained cold and broken during the last three days—the 29th and 30th were dull, cold, damp days. On the 31st some hours of bright sunshine occurred, but in the afternoon a sharp thunderstorm passed over Dublin from W.N.W.

The rainfall in Dublin during the seven months ending July 31st amounted to 15.994 inches on 109 days, compared with 7.935 inches on 80 days during the same period in 1887, and a twenty-three years' average of 14.749 inches, on 112.8 days.

At Greystones, Co. Wicklow, the rainfall in July, 1888, was 4.52 inches, distributed over 12 days. Of this quantity, 1.07 inches fell on the 24th, .46 inch on the 27th, and .43 inch on the 18th. From January 1 to the end of July, 19.43 inches of rain fell at Greystones, on, however, only 75 days.

AUGUST.—As in 1887, so in 1888, August proved to be rather cool, very breezy, and showery. On the whole, conditions were more favourable in Dublin than in many parts of the country.

In Dublin the mean temperature (58.2°) was decidedly below the average (59.6°); the mean dry bulb readings at 9 a.m. and 9 p.m. were 57.6°. In the twenty-three years ending with 1887, August was coldest in 1881 (M. T. = 57.9°), and warmest in 1871 (M. T. = 62.0°). In 1883, the M. T. was only 57.1°; in 1879 (the cold year) it was 57.7°; in 1887, it was 60.8°.

The mean height of the barometer was 29.957 inches, or 0.033 inch above the average value for August—namely 29.904 inches. The mercury marked 30.350 inches at 9 p.m. of the 31st, and fell to 29.389 inches at 9 p.m. of the 23rd. The observed range of atmospheric pressure was, therefore, 0.961 of an inch—that is, a little less than an inch. The mean temperature deduced from daily readings of the dry bulb thermometer at 9 a.m. and 9 p.m. was 57.6°, or 1.0° above the value for July, 1888; that calculated by Kaemtz's formula from the means of the daily maxima and minima was 57.0°, or 1.6° below the average mean temperature for August, calculated in the same way, in the twenty years, 1868–84, inclusive (58.9°). The arithmetical mean of the maximal and minimal readings was 58.2°, compared with a twenty-three years' average of 59.6°. On the 7th the thermometer in the screen rose to 71.8°—wind S.W.; on the 18th the temperature fell to 42.0°—wind S.E. The minimum on the grass was 39.2° on the latter date. The rainfall was 1.270 inches, distributed over twelve days. The average rainfall for August in the twenty-three years, 1865–87, inclusive, was 2.708 inches, and the average number of rainy days was 15.3. The rainfall, therefore, was considerably below the average, and so were the rainy days. In 1874 the rainfall in August was very large—4.944 inches on eighteen days—and in 1868, 4.745 inches fell on, however, only thirteen days. On the other hand, in 1884, only .777 inch was measured on eight days. In 1887, 1.620 inches of rain fell on sixteen days.

A solar halo appeared on the 18th. High winds were noted on as many as ten days, but did not attain the force of a gale on any one occasion. The atmosphere was foggy on the 16th. Thunder was heard on the 21st. Hail fell in heavy showers on the 29th. Temperature reached or exceeded 70° in the screen on only one day—or nine fewer than in August, 1887.

The month opened with a fair promise, and fine weather prevailed until Saturday, the 4th, on which day a depression, growing rapidly deeper, passed from Scotland across the North Sea, causing rain and squalls.

The weather of the week ending Saturday, the 11th, was finer and drier than had been the case for a long time before, and over England temperature rose to a high level for the time of year—maxima exceeding 80° being registered over the midland and south-eastern counties on Thursday and Friday, the 9th and 10th. In London and at Cambridge the thermometer reached 85° during this warm period. In Dublin the mean height of the barometer was 30.042 inches—pressure ranging from 30.202 inches at 9 p.m. of Sunday, the 5th, to 29.919 inches, at 9 p.m. of Saturday, the 11th. The mean temperature deduced from readings of the dry-bulb thermometer, taken daily at 9 a.m.

and 9 p.m., was 50°; that deduced from the maximal and minimal daily temperatures was 60·9°. The thermometer rose to 71·4° in the shade on Tuesday, having fallen to 46·6° on Sunday. Rain fell on two days—the total measurement being 2·62 of an inch, of which 2·18 of an inch was registered on Sunday.

The week ending Saturday, the 18th, was a period of fine weather—conditions were generally favourable, except on Sunday and Monday, when a rather deep depression was passing in a north-easterly direction across Ireland and Scotland, accompanied by showers and squalls. As this disturbance passed away, the sky cleared, and quiet, bright weather was experienced with a much lower temperature, particularly at night. In France and the south of England it was not so fine as in Ireland and Scotland, owing to the approach of some shallow depressions from the Peninsula. The wind was at first N.W., afterwards it settled in the N.E. and E. points of the compass. In Dublin the mean height of the barometer was 30·110 inches, the readings varying from 29·481 inches at 9 p.m. of Sunday to 30·314 inches at 9 a.m. of Saturday. The mean temperature, deduced from readings of the dry-bulb thermometer, taken daily at 9 a.m. and 9 p.m., was 53·8°; that deduced from the maximal and minimal daily temperatures was 50·0°. The thermometer in the shade rose to 63·6° on Sunday and fell to 42·0° on Saturday. Rain fell on only one day—Sunday—in appreciable amount, the measurement being 0·61 inch.

Although moderately warm, the weather was generally unsettled during the week ending Saturday, the 18th, and rain fell frequently and in many places heavily. The wind was chiefly southerly—on Sunday and Thursday it blew freshly in squalls. Sunday was dull and rainy. On Tuesday heavy thunder showers fell in the afternoon. On Thursday the wind freshened to a stiff breeze from S., and close rain fell for some time in and about Dublin. Friday and Saturday were fine, warm days. On Tuesday heavy thunderstorms and rains occurred over the southern half of France. In Dublin the mean height of the barometer was only 29·683 inches, or 4·26 inch below the corresponding value for the previous week (30·109 inches). Pressure was highest at 9 a.m. of Sunday (30·083 inches), and lowest at 9 p.m. of Thursday (29·389 inches). The mean temperature, deduced from readings of the dry-bulb thermometer taken daily at 9 a.m. and 9 p.m., was 59·3°; that deduced from the maximal and minimal daily temperatures was 59·8°. The screened thermometers rose to 67·0° on Friday and fell to 50·1° on Sunday. Rain was measured on four days, the total precipitation being 4·99 inch. Of this amount 2·31 inch fell on Tuesday, and 2·28 inch on Sunday.

The closing period of the month from Sunday, the 26th, to Friday, the 31st, was chiefly variable, showery, and decidedly cool for the time of year. The month closed, however, as it had opened, with a high barometer and quiet, fine weather. On Tuesday, the 28th, a secondary depression, which grew much deeper as it moved, travelled across England from the south of Wales to Lincolnshire. It caused fresh gales and heavy rains with thunder all over England; in Ireland drizzling showers of rain and in places hail. As this disturbance passed off, the barometer rose quickly to the maximum for the month, 30·330 inches, at 9 p.m. of Friday, the 31st, while the wind drew towards N. with cool, dry weather.

The rainfall in Dublin during the eight months ending August 31st amounted to 17·264 inches on 121 days, compared with 9·435 inches on 96 days during the same period in 1887, and a twenty-three years' average of 17·515 inches, on 127·1 days.

At Greystones, County Wicklow, the rainfall in August, 1888, was 1·53 inches, distributed over 11 days. Of this quantity, 37 inch fell on the 19th, 34 inch on the 22nd, and 18 inch on the 2nd. From January 1 to the end of August, 20·96 inches of rain fell at Greystones, on, however, only 96 days.

SEPTEMBER.—September, 1888, proved a fine month, with very high barometer, variable light winds, a scanty rainfall, low temperature, and frequent fogs. The prevailing winds were from polar quarters—from N.W., N., and E. An anticyclonic distribution of pressure held over the British Islands and Central Europe during the greater part of the month, and in Dublin the barometer remained continuously above 30 inches from the evening of the 6th to the night of the 27th.

In Dublin the mean temperature (54·4°) was—as in 1887—decidedly below the average (55·8°); the mean dry bulb readings at 9 a.m. and 9 p.m. were 53·7°. In the twenty-three years ending with 1887, September was coldest in 1866 and in 1882 (M. T. = 53·0°), and warmest in 1865 (M. T. = 61·4°). In 1889 the M. T. was as high as 56·0°; in the year 1879 (the cold year) it was 54·3°; and in 1887, it was 54·0°.

The mean height of the barometer was 30·179 inches, or 0·362 inch below the average value for September—namely, 30·541 inches. The mercury marked 30·516 inches at 9 a.m. of the 8th, and fell to 29·783 inches at 9 a.m. of the 25th. The observed range of atmospheric pressure was, therefore, only 7·33 of an inch, that is, a little less than three-quarters of an inch. The mean temperature deduced from daily readings of the dry-bulb thermometer at 9 a.m. and 9 p.m. was 53·7°, or 8·9° below the value for August, 1888; that calculated by Kaemtz's formula from the means of the daily maxima and minima was 53·4°, or 17° below the average mean temperature for September, calculated in the same way, in the twenty years, 1865–84, inclusive (55·1°). The arithmetical mean of the maximal and minimal readings was 54·0°, compared with a twenty-three years' average of 55·6°. On the 8th the thermometer in the screen rose to 65·6°—wind N.W.; on the 30th the temperature fell to 39·2°—wind N. The minimum on the grass was 34·0° on the latter date. The rainfall was only 7·28 of an inch, distributed over ten days—both rainfall and rainy days were much below the average. The average rainfall for September in the twenty-three years, 1865–87, inclusive, was 2·285 inches, and the average number of rainy days was 15·0. In 1871 the rainfall in September was very large 4·048 inches on, however, only thirteen days. On the other hand, in 1865, only 4·66 inch was measured on but three days.

A solar halo appeared on the 27th. High winds were noted on only three days, and did not attain

the force of a gale on any occasion. Hail fell on the 6th. The atmosphere was foggy on the 8th, 9th, 15th, 17th, and five following days, and on the 28th. Heavy dews and wet fogs were experienced at night during the anticyclonic period of about the middle of the month.

On Saturday, September 1st, pressure gave way quickly, the wind backed to S.W. and freshened to a stiff breeze, with increasing cloud, slight showers, and a rising temperature.

During the week ending Saturday, the 8th, the weather was changeable, with prevalent W. to N.W. winds. Until Friday atmospheric pressure was low in the North, and many secondary depressions passed in an easterly direction across Ireland and Great Britain. At the close of the week an anticyclone, in which the barometer stood above 30.50 inches, advanced over Ireland from the Atlantic, its easterly movement being accompanied with a shift of wind towards N., a falling temperature, and drier and lighter weather. Showers fell on several days, but heavily on Thursday alone. On that day hail was observed, and thunder was heard at Monkstown, Co. Dublin. In Dublin the mean height of the barometer was 30.076 inches; pressure ranged between 29.672 inches at 9 a.m. of Tuesday, and 30.516 inches at 9 a.m. of Saturday. The mean dry-bulb temperature, deduced from observations taken daily at 9 a.m. and 9 p.m., was 53.3°. The mean of the daily maxima and minima was 56.4°. Temperature rose to 65.5° on Wednesday (wind, W.S.W.), and fell to 43.3° on Saturday (wind N.). Rain fell on four days to the amount of .304 inch—of this quantity .232 inch was registered on Thursday, when hail fell with the rain. There was a slight smoke fog on Saturday evening.

In the second week (9th-15th), inclusive) quiet dry weather prevailed generally. The type of distribution of atmospheric pressure was chiefly anticyclonic. At first temperature was very low—the maximum on Sunday being only 53.7°. The nights were cold, and heavy dews fell. On Friday the barometer gave way considerably, and at night a good deal of rain fell, as a shallow V-shaped depression came in from the westward. The wind was throughout light and variable; on Sunday it blew from N.E., on Monday and Tuesday from N.W., then from S.E., and finally on Saturday from S.W. and N.W. In Dublin the mean height of the barometer was 30.310 inches—pressure ranged from 30.473 inches at 9 p.m. of Wednesday to 30.063 inches at 9 a.m. of Saturday. The mean temperature, deduced from readings of the dry-bulb thermometer, taken daily at 9 a.m. and 9 p.m., was 54.2°; that deduced from the daily maxima and minima was 54.8°. Temperature rose to 64.1° on Friday (wind, S.E.), and fell to 42.4° on Thursday (wind, S.E. also). Rain fell on Friday night to the amount of .119 inch, and on Saturday .011 inch was registered—total precipitation .130 inch on two days.

Throughout the week ending Saturday, the 22nd, the weather was governed by a large area of high atmospheric pressure (anticyclone), which stretched across Central Europe from west to east. The changes in pressure were slight within the limits of the anticyclone, but on Friday a decided depression passed across the north of Scandinavia. Quiet, cool weather accompanied the anticyclone. At first the sky was clear, but dense wet ground fogs at night were finally followed by dull, cloudy days, and the week closed with gloomy weather. In Dublin the mean height of the barometer was 30.303 inches; the highest reading was 30.352 inches at 9 a.m. of Tuesday, the lowest was 30.260 inches at 9 p.m. of Saturday. The extreme range of pressure was, therefore, only .092 inch. The mean temperature deduced from readings of the dry-bulb thermometer taken daily at 9 a.m. and 9 p.m. was 52.1°. The mean of the maximal and minimal daily temperatures was 53.4°. The thermometer rose to 61.7° on Monday (wind, N.N.W.), and Wednesday (wind, E.N.E.), and fell to 43.3° on Tuesday (wind, E.N.E.). At some inland stations the diurnal range of temperature was very large on several days. No rain fell, but the ground was watered by the heavy dews and wet fogs, which were the chief phenomena of the week.

During the week ending Saturday, the 29th, the weather remained favourable, although it was less settled than in the previous week. At first the atmosphere was very hazy, and the amount of cloud was large. An extensive but shallow area of low pressure formed over southern England, St. George's and the English Channels, and France, on Sunday and Monday, causing rain or showers and some thunderstorms in those regions. On Tuesday a strong easterly wind blew in the Irish Sea. Wednesday and Thursday were fine, but on the latter day the sky became overcast, a solar halo appeared in a canopy of "sheep-cirrus," and rain fell in the evening and at night. Friday and Saturday were mild, cloudy days. On Saturday afternoon a shift of wind from W. to N. took place, some showers fell and temperature, which had been comparatively high, gave way rapidly. In Dublin the mean height of the barometer was 30.000 inches, or .237 inch below the mean for the preceding week. Pressure rose to 30.270 inches at 9 a.m. of Wednesday, and fell to 29.783 inches at 9 a.m. of Saturday. The mean temperature deduced from daily readings of the dry-bulb thermometer at 9 a.m. and 9 p.m. was 53.6°. The arithmetical mean of the highest and lowest daily temperatures was 54.4°. Temperature was highest, 62.6°, on Friday (wind, S.S.E.), and lowest, 45.9°, on Saturday (wind, N.). Rain fell on three days to the amount of .255 inch. On Thursday the measurement was .216 inch. A solar halo was seen at noon of that day.

Sunday, the 30th, was a clear, cold day, with bright sunshine at first, and a crisp air [and northerly breeze. The minimal temperature on this day was 39.2°.

The rainfall in Dublin during the nine months ending September 30th amounted to 17.932 inches on 131 days, compared with 10.968 inches on 112 days during the same period in 1887, and a twenty-three years' average of 19.803 inches, on 143.4 days.

At Greystones, Co. Wicklow, the rainfall in September, 1888, was .67 of an inch, distributed over only five days. Of this quantity, .26 of an inch fell on the 28th, and .26 of an inch on the 1st. From January 1 to the end of September, 21.63 inches of rain fell at Greystones, on, however, only 91 days.

OCTOBER.—A generally favourable month, with much quiet fine weather except at the beginning and end. The first week was very cold and showery, and fresh northerly winds prevailed. An anticyclonic period followed, in which the weather was chiefly fine, but foggy or cloudy. Except for a few hours on the 12th, the barometer did not fall below 30 inches from the 6th to the 26th inclusive. The last seven days were remarkably warm, with strong S.W. winds or gales and frequent showers. Temperature was giving way decidedly at the very close of the month.

In Dublin the mean temperature (49.1°) was—as in September—below the average (49.6°); the mean dry bulb readings at 9 a.m. and 9 p.m. were 48.2° . In the twenty-three years ending with 1887, October was coldest in 1880 (M. T. $=45.4^{\circ}$), and in 1883 (M. T. $=45.5^{\circ}$), and warmest in 1878 (M. T. $=53.1^{\circ}$). In 1886, the M. T. was as high as 52.0° ; in the year 1879 (the "cold year"), it was 49.7° ; and in 1887 it was as low as 47.3° .

The mean height of the barometer was 30.030 inches, or 0.188 inch above the average value for October—namely, 29.847 inches. The mercury rose to 30.417 inches at 9 p.m. of the 21st, and fell to 29.230 inches at 9 p.m. of the 2nd. The observed range of atmospheric pressure was, therefore, 1.187 inches—that is, a little less than an inch and two-tenths. The mean temperature deduced from daily readings of the dry bulb thermometer at 9 a.m. and 9 p.m. was 48.2° , or 0.5° below the value for September, and 0.8° below that for August, 1888; that calculated by Kaemtz's formula from the means of the daily maxima and minima was 48.1° , or 1.1° below the average mean temperature for October, calculated in the same way, in the twenty years, 1865–84, inclusive (49.2°). The arithmetical mean of the maximal and minimal readings was 49.1, compared with a twenty-three years' average of 49.8° . On the 27th the thermometer in the screen rose to 66.0° —wind S.S.W.; on the 2nd the temperature fell to 32.9° —wind N.W. The minimum on the grass was 27.0° on the 6th. The rainfall was 1.227 inches, distributed over 16 days—both rainfall and rainy days were perceptibly more than the values for the preceding month of September—viz., 728 of an inch on 10 days. The average rainfall for October in the twenty-three years, 1865–87, inclusive, was 3.111 inches, and the average number of rainy days was 17.4. The rainfall, therefore, was again much below the average, and the rainy days were slightly below it. In 1880 the rainfall in October was very large—7.238 inches on 15 days. In 1875, also, 7.049 inches fell on 26 days. On the other hand, in 1884, only .834 inch was measured on but 14 days, and in 1868 only .456 inch on 15 days.

Lunar halos appeared on the 15th and 20th. High winds were noted on 7 days, and attained the force of a gale on three occasions, the 26th, 28th, and 30th. The atmosphere was more or less foggy in Dublin on the 9th, 11th, 13th, 16th, 17th, 22nd, and 23rd. Lightning was seen on the night of the 2nd, when thunder-showers passed along the Welsh coast over the sea from N.N.W. to S.S.E. Hail fell with heavy showers of rain on the 3rd and 6th.

Not for many years has October been ushered in with such cold and inclement weather as that which prevailed during the first week. A succession of polar depressions, or cyclonic systems, with their subsidaries, travelled southwards, or south-westwards, across Western Europe. Strong northerly (N.W. to N.E.) winds were consequently prevalent over the British Islands, accompanied by squalls of cold rain, hail, and sleet or snow. On Monday, the 1st, icy rain fell and the Dublin and Wicklow mountains became snow-capped; a sharp frost followed at night, when the thermometer in the screen fell to 27° at Farnestown. Lightning occurred over the Irish Sea on Tuesday evening. Hail fell next morning and also on Saturday. In Dublin the mean height of the barometer was 29.735 inches, or .331 inch below the mean for the previous week (30.066 inches), and no less than .568 inch below that for the week ending September 22nd. The barometer rose to 30.226 inches at 9 p.m. of Saturday (wind N.), having fallen to 29.230 inches at 9 p.m. on Tuesday (wind, N.W.). The mean temperature deduced from daily readings of the dry bulb thermometer at 9 a.m. and 3 p.m. was 41.7° , or nearly 12° below the corresponding value for the preceding week (53.6°), and fully 10° below the average for the time of year. The arithmetical mean of the highest and lowest daily temperatures was 42.6° . Temperature rose to 52.8 on Thursday (wind, W.) and fell to 32.9° on Tuesday (wind, N.W.). Rain fell on five days—the total measurement being .384 inch, of which .170 of an inch was measured on Monday. Hail fell on Wednesday and Saturday, and lightning was seen on Tuesday evening.

In the period from the 7th to the 13th inclusive, the weather was generally favourable and much milder than during the previous week. The barometer was throughout highest off the west and southwest of Ireland, so that the prevailing winds were N.W. and W. Some extensive, although not unusually deep depressions, passed eastwards across Scotland, the Norwegian Sea, and Scandinavia during the week; consequently, the amount of cloud was large, and the wind freshened considerably at times, with a decided rise of temperature in Ireland. Sharp night frosts occurred in the midland and eastern counties of England until Tuesday. Very little rain fell in the United Kingdom, but in Southern Germany there were heavy rains and snows in the earlier part of the week. In Dublin the mean height of the barometer was 30.167 inches, or .422 of an inch above the mean for the preceding week (29.735 inches). The mercury rose to 30.273 inches at 8 a.m. of Monday (wind N.W.), and fell to 29.954 inches at 9 p.m. of Friday (wind W.). The mean temperature deduced from daily readings of the dry bulb thermometer at 9 a.m. and 9 p.m. was 48.7° or 7° above the value for the previous week (41.7°). The arithmetical mean of the highest and lowest daily temperatures was 49.5° . Temperature in the screen rose to 50.5° on Friday (wind, W.), having fallen to 40.1° on Sunday (wind, N.W.). Rain fell on two days—the total measurement being only .063 of an inch, of which amount .073 of an inch fell on Sunday. The air was slightly foggy on the mornings of Tuesday and Thursday. A rapid fall of temperature occurred on Friday night.

During the week ended Saturday, the 26th, the weather was generally favourable—brilliant at the beginning and close; dull, foggy and showery in the intervening period, when atmospheric

depressions were travelling northwards outside the western shores of Ireland and Scotland. In England the diurnal range of temperature was considerable, calm, foggy, frosty nights being succeeded by bright, warm days. In Scotland and Ireland the greater prevalence of clouds checked radiation, and so the extremes of temperature were less pronounced. In Dublin the mean height of the barometer was as much as 30.282 inches, the readings varying from 30.373 inches at 9 a.m. of Monday (wind, W.N.W.) to 30.101 inches at 9 p.m. of Thursday (wind, S.S.E.). The mean temperature, deduced from readings of the dry bulb thermometer taken daily at 9 a.m. and 9 p.m., was 47.1°; that deduced from the highest and lowest daily temperatures was 48.7°. The thermometers in the screen rose to 58.4° on Thursday (wind, S.S.E.), and fell to 35.1° on Sunday (wind, W.N.W.). Rain fell on three days, but only .072 of an inch was registered. Of this amount, .032 of an inch was measured on Tuesday.

In the fourth week (21st to 27th inclusive), conditions were at first anticyclonic, and the weather was fine and quiet, with mild, bright days, and cold foggy nights. At 7.45 p.m. of Tuesday, the thermometer read 42.2°, and a dense fog prevailed in Dublin; an hour later temperature was 7° higher, a S.W. wind was blowing, and there was clear moonlight. Atmospheric pressure now gave way in the W. and N., and a mild south-westerly current set in, causing a decided and remarkable rise of the thermometer. The last three days of the week were summerlike as regards temperature, but strong S.W. winds and showers took the place of the previous calms and fogs. The mean temperature of Saturday was 63.9°, or about 16° above the average for the time of year. On this day the screen thermometer rose to 66.0°, but did not fall below 61.2°. The mean of the 9 a.m. and 9 p.m. readings was 62.9°. In Dublin the mean height of the barometer was 30.040 inches. The mercury rose to 30.417 inches at 9 p.m. of Sunday (wind calm), and fell to 29.664 inches at 9 p.m. of Thursday (wind S.S.W.). The mean temperature deduced from daily readings of the dry bulb thermometer at 9 a.m. and 9 p.m. was 53.0°, or 11.3° above that for the week ending October 3. The arithmetical mean of the highest and lowest daily temperatures was 52.9°. Temperature in the screen rose to 66.6° on Saturday (wind, S.S.W.), having fallen to 33.1° on Tuesday (wind, W.). Rain fell on three days to the amount of .429 of an inch. Of this quantity .351 of an inch was measured on Saturday.

The last four days of the month were changeable, south-westerly gales prevailing on Sunday, the 28th, and Tuesday, the 30th. Temperature showed a gradual but decided tendency to fall while the wind drew towards W.

The rainfall in Dublin during the ten months ending October 31st amounted to 19.219 inches on 127 days, compared with 13.300 inches on 123 days during the same period in 1887, and a twenty-three years' average of 22.014 inches on 109.6 days.

At Greystones, Co. Wicklow, the rainfall in October, 1888, was 2.23 inches, distributed over 13 days. Of this quantity .03 of an inch fell on the 27th, and .36 of an inch on the 1st. From January 1 to the close of October, 23.86 inches of rain fell at Greystones, on, however, only 104 days.

NOVEMBER.—This was the wettest and most stormy November experienced in Dublin since the present records were begun more than a quarter of a century ago. There was scarcely any frost, and on two occasions severe thunderstorms occurred. Until the 15th, an anticyclone held over Scandinavia and the Baltic, while pressure was low to the south-westward and finally to the north-westward of the British Islands. Hence strong S.E. to S.W. winds and gales prevailed, and rain fell frequently. During the later half of the month the barometer was very low in the far North, but high over France and Spain; hence strong W. winds or gales were prevalent, and the rainfall was again excessive. In Dublin, the precipitation was nearly three times the average, and there were only four days on which no rainfall was registered. The mean temperature was 5° above the average.

In Dublin the mean temperature (47.5°) was much above the average (44.5°); the mean dry bulb readings at 9 a.m. and 9 p.m. were 47.4°. In the twenty-three years ending with 1887, November was the coldest in 1878 (M. T. = 38.2°), and in 1870 (M. T. = 42.2°), and warmest in 1881 (M. T. = 50.3°). In 1888, the M. T. was as high as 49.4°; in the year 1879 (the "cold year"), it was 43.9°; and in 1887 it was as low as 42.6°.

The mean height of the barometer was 29.690 inches, or 0.177 inch below the average value for November—namely, 29.867 inches. The mercury rose to 30.168 inches at 7 p.m. of the 21st, and fell to 29.075 inches at 3 p.m. of the 27th. The observed range of atmospheric pressure was, therefore, 1.093 inches—that is, a little less than an inch and one-tenth. The mean temperature deduced from daily readings of the dry bulb thermometer at 9 a.m. and 9 p.m. was 47.4°, or only 0.8° below the value for October, and 6.3° below that for September, 1888; that calculated by Kaemitz's formula from the means of the daily maxima and minima was 46.6°, or 3.1° above the average mean temperature for November, calculated in the same way, in the twenty years, 1863–84, inclusive (43.7°). The arithmetical mean of the maximal and minimal readings was 47.5°, compared with a twenty-three years' average of 44.5°. On the 16th the thermometer in the screen rose to 59.50° in the night—wind S.W.; on the 28th the temperature fell to 30.8°—wind calm. The minimum on the grass was 25.0° on the 28th. The rainfall was 6.549 inches, distributed over 26 days—both rainfall and rainy days were largely in excess of the values for the preceding month of October—viz., 1.227 inches on 16 days. The average rainfall for November in the twenty-three years, 1863–87, inclusive, was 2.340 inches, and the average number of rainy days was 16.9. The rainfall, therefore, was very much above the average, and the rainy days were equally in excess of it. In 1876 the rainfall in November was large—3.614 inches on 29 days. In 1872, also, 3.414 inches fell on 24 days, and in 1837, 3.012 inches fell on 18 days. On the other hand, in 1870, only 1.218 inches were measured on but 11 days, and in 1879 only 1.251 inches on but 10 days. The vast excess of the rainfall in 1888 is evident from these figures.

A lunar corona appeared on the 24th. High winds were noted on 18 days, and attained the force

of a gale on ten occasions, the 2nd, 4th, 10th, 12th, 15th, 16th, 22nd, 24th, 25th, and 29th. The atmosphere was more or less foggy in Dublin on the 13th, 14th, 28th, 29th, and 30th. Lightning was seen on the night of the 1st. Severe thunderstorms occurred on the 20th and 28th. Hail fell with heavy showers of rain on the 5th, 6th, 20th, and 26th. Sleet and snow fell on the 20th and 27th.

Early on the morning of Thursday, November 1, the wind shifted to N., afterwards veering towards N.E. and E. Some flashes of lightning were seen after 9 p.m. of this day. A heavy fall of rain occurred on Friday evening. Saturday, the 3rd, was a mild dull day.

Very unsettled, squally, wet weather held almost throughout the week ending Saturday, the 10th. On Tuesday and Wednesday conditions were temporarily more favourable, an easterly air-current having gained the upper hand. At this time temperature became low and the air much drier than previously or afterwards. The bad weather was determined by the permanent position taken up by an area of high atmospheric pressure over Scandinavia, while a series of atmospheric depressions approached the S.W. of Ireland from the Atlantic, but made no further progress in an easterly or north-easterly direction. Strong S.E. winds or gales and heavy rains accordingly prevailed in Ireland, the E. and S.E. coasts suffering most severely, as is usual under the circumstances. In England and Scotland the weather was colder and drier, while in Germany sharp frost occurred. In Dublin the mean height of the barometer was 29.708 inches. The mercury rose to 29.900 inches at 9 a.m. of Tuesday (wind E.), and sank to 29.400 inches at 4 p.m. of Saturday (wind S.E.). The temperature deduced from daily readings of the dry bulb thermometer at 9 a.m. and 9 p.m. was 47° . The arithmetical mean of the highest and lowest daily temperatures was also 47° . Temperature in the screen rose to 55.4° on Monday (wind E.S.E.), and sank to 39.9° on Wednesday (wind also E.S.E.). There were gales on Sunday, Thursday, and Saturday, and rain fell on six days to the large amount of 1.739 inches. Of this quantity, .652 of an inch was measured on Sunday (wind E.S.E.).

In the second week (11th to 17th inclusive) the weather was rough and unsettled, except on Sunday, Tuesday, and Wednesday, which were fine days. The rainfall was indeed far less heavy than in the previous week, but the storms were more severe. Temperature remained very high for the season, particularly at night, and in fact the highest reading for the month (59.5°) occurred at night, in the early morning hours of Friday, the 16th. At first the winds were S. to S.E., but after Tuesday they varied between S. and W., and on Saturday they drew into W.N.W. In Dublin the mean height of the barometer was 29.600 inches, the readings ranging from 29.292 inches at 9 p.m. of Monday (wind S.E.) to 29.983 inches, at 9 p.m. of Saturday (wind W.N.W.). The mean temperature deduced from daily readings of the dry bulb thermometer at 9 a.m. and 9 p.m. was 50.3° , or 6° above the average for the time of year. The arithmetical mean of the highest and lowest temperatures was 50.1° . The thermometer in the screen rose to 59.5° on the early morning of Friday (wind S.W.), and fell to 42.1° on Sunday (wind S.S.W.). Rain fell on five days to the amount of .545 inch, the largest fall in 24 hours being .310 inch on Monday. Hail occurred at 1.15 p.m. of Friday. At 8 a.m. of Saturday atmospheric pressure ranged from 29.67 inches at Bodø, in the N.W. of Norway, to 30.46 inches at Lyons. Under these circumstances very strong S.W. to W. gales prevailed over Western Europe.

During the weekend Saturday, the 24th, there was another period of open, stormy, rainy weather. Throughout the week the barometer was very low over the northern parts of Scandinavia and the Norwegian Sea (29.36 inches to 29.40 inches), and equally high over the Peninsula and southern France (30.31 inches to 30.61 inches). Accordingly, strong S.W. and W. gales swept in rapid succession across the British Islands, accompanied by generally high but unsteady temperature and frequent showers of rain. On Tuesday, a sudden cold "snap" occurred—sleet, snow, and hail fell, and at 2.40 p.m. a sharp storm of thunder, lightning, hail, and grapple passed over Dublin from W.N.W. The lightning was very vivid and of a deep violet colour. On Wednesday temperature rose again, remaining very high to the close of the week, except in Scotland, where a second "chill" was experienced on Friday. In Dublin the mean atmospheric pressure was 29.985 inches; the barometer fell to 29.701 inches at 9 p.m. of Monday (wind W. by N.), and rose to 30.168 inches at 7 p.m. on Wednesday (wind W.S.W.). The mean temperature deduced from daily readings of the dry bulb thermometer at 9 a.m. and 9 p.m. was 49.7 or 5.5° above the average for the time of the year. The arithmetical mean of the highest and lowest daily temperatures was 49.6° . Temperature in the screen rose to 56.5° on Saturday (wind W.S.W.), having fallen to 37.4° on Tuesday (W.N.W.). Rain fell on six days to the amount of .428 inch. The largest rainfall in 24 hours was .108 inch on Monday. There was a lunar corona at 11.30 p.m. of Saturday.

The stormy, rainy weather so prevalent throughout the month reached a climax in the period from the 25th to the 30th inclusive. It was ushered in by a fresh to strong S.W. gale, a high temperature, and heavy showers on Sunday, the 25th. A hail occurred next day, but Tuesday, the 27th, was a cold wet day, temperature not rising above 41.4° , and sleet falling mingled with rain. A frosty night and morning followed, but on Wednesday a dense sheet of cirro-stratus overspread the sky from S.W., while detached cumulus clouds came up in an unrecurrent from S.E. In the afternoon rain and hail fell in torrents, accompanied by much thunder and strangely vivid lightning. The rainfall in the storm amounted to 1.311 inches, most of which fell within three hours. On Thursday there was an easterly to southerly gale, and a driving rain continued for several hours. The last day of the month was wet and gloomy to fine. In Dublin the barometer sank to 29.076 inches at 3 p.m. of Tuesday, the 27th (wind N.N.W.). Temperature in the screen rose to 57.5° on Sunday forenoon (wind, S.W.), and fell to 30.6° on Wednesday morning (wind, calm). Rain fell on every one of the six days, to the amount of no less than 3.013 inches, of which .644 of an inch was measured on Tuesday, 27th; 1.519 inches on Wednesday, 28th; and .527 of an inch on Thursday, 29th—2.590 inches on three days.

The rainfall in Dublin during the ten months ending November 30th amounted to 25.708 inches on 173 days, compared with 15.378 inches on 141 days during the same period in 1887, and a twenty-three years' average of 25.254 inches on 177.4 days.

At Greystones, Co. Wicklow, the rainfall in November, 1888, was 5.02 inches, distributed over 19 days. Of this quantity $\frac{3}{4}$ of an inch fell on the 29th, $\frac{1}{2}$ of an inch on the 30th, and $\frac{1}{4}$ of an inch on the 2nd. From January 1 to the end of November, 28.38 inches of rain fell at Greystones, on, however, only 123 days.

DECEMBER.—A mild changeable month, setting in with a period of warmth, which was remarkable for the time of year, the mean temperature of the first week being as high as 51°. Southerly winds (S.E. through S. and S.W. to W.) vastly preponderated. Fogs were prevalent in an anticyclonic period from the 9th to the 18th. A very sharp frost occurred on Sunday, the 30th, the maximal temperature during the day being only 39°. There were but three gales. On eight days the sky was overcast—on four it was clear.

In Dublin the mean temperature (43.6°) was—as in November—above the average (41.1°); the mean dry bulb readings at 9 a.m. and 9 p.m. were 43.3°. In the twenty-three years ending with 1887, December was coldest in 1879 (M.T. = 32.8°), and in 1874 (M.T. = 36.8°), and warmest in 1865 (M.T. = 46.2°). In 1888, the M.T. was as low as 37.9°; in the year 1879 (the "cold year") it was also 37.9°. In 1887 the M.T. was 39.9°.

The mean height of the barometer was 29.846 inches, or 0.064 inch below the average value for December—namely, 29.910 inches. The mercury rose to 30.565 inches at 9 a.m. of the 16th and fell to 28.586 inches at 8 p.m. of the 21st. The observed range of atmospheric pressure was, therefore, 1.979 inches—that is, a little less than two inches. The mean temperature deduced from daily readings of the dry bulb thermometer at 9 a.m. and 9 p.m. was 43.3°, or $\frac{1}{2}$ ° below the value for November, and $\frac{1}{2}$ ° below that for October, 1888; that calculated by Kew's formula from the means of the daily maxima and minima was 46.7°, or 2.2° above the average mean temperature for December, calculated in the same way, in the twenty years, 1868–84, inclusive (40.5°). The arithmetical mean of the maximal and minimal readings was 43.6°, compared with a twenty-three years' average of 41.1°. On the 3rd and the 5th the thermometer in the screen rose to 59.6°—wind S.S.W. and S. respectively; on the 30th the temperature fell to 26.4°—wind W. The minimum on the grass was 22.3° on the 30th. The rainfall was 2.911 inches, distributed over 17 days. The average rainfall for December in the twenty-three years 1868–87, inclusive, was 2.419 inches, and the average number of rainy days was 17.0. The rainfall therefore, was decidedly above the average, while the rainy days were equal to it. In 1876 the rainfall in December was very large—7.666 inches on 22 days. In 1872, 4.952 inches fell on as many as 24 days; and in 1868 (which was otherwise a fine and dry year), 4.749 inches fell on as many as 27 days. On the other hand, in 1867, only .771 of an inch was measured on 13 days; and in 1871, the December rainfall was only .797 of an inch on 15 days. In 1885, only .742 of an inch of rain was measured on but 10 days, but in 1886 the rainfall was 8.348 inches, distributed over as many as 21 days. In 1887 ("the dry year"), the rainfall was 1.223 inches on 19 days.

A lunar halo appeared on the 26th, and a solar halo on the 15th. There was a lunar rainbow on the night of the 21st. High winds were noted on 10 days, and attained the force of a gale on three occasions, the 6th, 11th, and 21st. The atmosphere was more or less foggy in Dublin on the 5th, 9th, 10th, 12th, 13th, 14th, 17th, 18th, and 30th. Lightning was seen on the night of the 27th. Hail fell with heavy showers of rain on the 11th. Neither sleet nor snow was observed during the month. Saturday, the 1st, was a mild fine day.

Generally mild, but cloudy and rainy, weather prevailed during the greater part of the first week. Saturday, the 8th, only was cool and bright. Until this day an area of high barometer (anticyclone) held over France and Germany, while rather steep gradients for S. and S.W. winds lay across the British Isles and Scandinavia. In southern Germany and central France sharp frost occurred daily after Sunday the 2nd, but within the region of the south-westerly winds the air was remarkably soft and warm. Atmospheric pressure became equalised over Western Europe on Friday, so that the wind fell light, the sky cleared, and temperature fell fast. In Dublin the mean height of the barometer was 29.862 inches—the highest reading being 30.296 inches at 9 p.m. of Saturday (wind W.), and the lowest 29.484 inches, at 9 a.m. of Monday (wind S.S.W.). The mean temperature deduced from daily readings of the dry bulb thermometer at 9 a.m. and 9 p.m. was 51.4°, or 8.8° above the corresponding value for the previous week, and 9.7° above that for the week ending October 6, 1888 (41.7°). The arithmetical mean of the highest and lowest daily temperatures was 51.8°. Temperature in the screen rose to 59.6° on Monday (wind S.S.W.), and in the night of the 4th–5th (Tuesday–Wednesday) (wind S.), and fell to 39.0° on Saturday (wind W.). Rain fell on six days—the total precipitation was .482 inch, and the maximal fall in 24 hours was .213 inch on Sunday.

Much quieter, colder, and—on the whole—finer weather was experienced in the second week, (9th–15th inclusive). Atmospheric pressure ranged high, and the wind was generally light and variable, except in the extreme west of Ireland and of Scotland, where it blew freshly from S. or S.W. on several occasions. At the beginning of the period, an anticyclone came in from the Atlantic, sending calms and frost on Sunday, with much fog at night. Next day this system moved eastwards to Great Britain, and an irregular depression encroached on the Irish coasts, resulting in cloud and rain with a rise of temperature. For some days an anticyclone held over the Continent, the North Sea, and Great Britain, while depressions skirted the W. of Ireland on their journey northwards. On Friday, a new high pressure system showed over Donegal, afterwards spreading eastwards; so that on Saturday light northerly winds and cool fair weather prevailed. In Dublin the mean height of the barometer was 30.248 inches, pressure varying from 30.067 inches at 9 a.m. of Tuesday (wind S.E.) to 30.542 inches at 9 p.m. of Saturday (wind N.W.). The mean temperature deduced from

readings of the dry bulb thermometer, taken daily at 9 a.m. and 9 p.m., was 40.8°; that deduced from the daily maxima and minima was 41.3°. Temperature rose to 49.3° in the forenoon on Tuesday (wind S.E.); and fell to 28.1° on Monday (wind calm). Rain fell on three days to the amount of .333 inch, the largest fall in 24 hours being .193 inch on Monday. Hail fell on Tuesday morning. There were dense fogs on Monday and Friday. A solar halo was seen on Saturday.

At first fine, cool, and quiet, the weather became very wet, mild, and squally in the third week, ending Saturday, the 22nd—an anticyclone giving place to a series of deep depressions, which travelled in a north-easterly direction across Ireland, the Irish Sea, and Great Britain. On Sunday afternoon a light canopy of lofty cirrus cloud reflected the sunlight for nearly an hour after sunset, and subsequently a "glory" and "corona" appeared round the moon. Two quiet, fine days followed; but on Wednesday the weather broke, becoming mild and rainy. In the evening rain fell heavily, in and about Dublin, owing to a cold indraught of air connected with a small subsidiary depression over the Irish Sea. The rainfall at Monkstown, Co. Dublin, was no less than 1.630 inches. In the city, .680 of an inch was measured, but in the Phoenix Park only .350 of an inch of rain fell. Thursday was fine, but on Friday a very deep depression advanced from S.W., the barometer falling below 29.50 inches near the centre of the system. Fresh S.E. gales and heavy rains resulted, and at night a distinct lunar rainbow was seen. Saturday was a stormy day, the wind backing from S.E. to N.N.E. In Dublin, the mean height of the barometer was 29.637 inches—pressure ranging from 30.343 inches, at 9 a.m. of Sunday (wind W.N.W.), to 28.388 inches at 8 p.m. of Friday (wind S.E.). The mean temperature deduced from readings of the dry bulb thermometer, taken daily at 9 a.m. and 9 p.m., was 43.1°. The highest shade temperature was 53.4° on Wednesday (wind S.); the lowest was 31.3° on Tuesday (wind S.W.). The arithmetical mean of the daily maxima and minima was 43.9°. Rain fell on four days, the total measurement being 1.501 inches, of which .680 inch fell on Wednesday, and .619 inch on Friday.

As regards the fourth week (23rd–29th, inclusive) the weather was at first changeable, and on Christmas Day rain fell heavily in showers, the barometer sinking only 29.154 inches at 3 p.m. The last three days were very fine, and the week closed with clear skies and frost. Sunday was dull and damp; at night temperature rose to 50.6°—the highest for the week. Monday was clear and bracing. Tuesday (Christmas Day) was ushered in by a bright "foreglow" at 8 a.m. and rainbow in the N.W. Drizzling showers and squalls from S.W. afterwards occurred. Next day was fine, bright, and cold; the thermometer did not rise above 39.7°. At night a new depression came in suddenly from the Atlantic and the wind freshened from S., with rain (.068 inch). Thursday proved fine in Ireland, but rainy and stormy in England. Faint lightning was seen in the S.E. from Dublin towards evening. Friday was fine, although cloudy at times. Towards evening the sky cleared and frost set in. Saturday was fair and frosty. In Dublin the mean height of the barometer was 29.009 inches—pressure ranging from 29.154 inches at 3 p.m. of Tuesday (wind S.W.) to 30.194 inches at 9 p.m. of Saturday (wind N.W.). The mean dry bulb temperature at 9 a.m. and 9 p.m. was 40.1°, while the arithmetical mean of the highest and lowest daily readings of the thermometer was 40.9°. Temperature rose to 50.6° on Monday (wind S.W.), and fell to 31.6° on Saturday (wind W. to N.W.). Rain fell on three days to the amount of .476 inch, of which .338 inch was measured on Tuesday. Lightning was seen on the evening of Thursday, the 27th, and there was a thick hoar frost on Saturday, the 29th.

On Sunday, the 30th, keen frost prevailed—the highest temperature being 30.7°. A vapour fog came on in the afternoon. A thaw ensued on the forenoon of the 31st, and towards evening some rain fell.

The rainfall in Dublin during the year ending December 31st amounted to 23.679 inches on 190 days, compared with 16.601 inches on 160 days during the same period in 1887, and a twenty-three years' average of 27.673 inches on 194.4 days.

At Greystones, Co. Wicklow, the rainfall in December, 1888, was 5.06 inches, distributed over 15 days. Of this quantity 1.08 inches fell on the 25th, .86 of an inch on the 21st, and .75 of an inch on the 19th. During the year 34.54 inches of rain fell at Greystones, on, however, only 188 days.

RAINFALL IN 1889,

At 40, Fitzwilliam-square, West, Dublin.

Rain Gauge:—Diameter of funnel, 8 in.; Height of top—Above ground, 3 ft. 2 in.; above sea level, 57 ft.

The rainfall was almost exactly one inch in excess of the average annual measurement of the twenty-three years, 1865-87, inclusive—viz., 27.673 inches.

It will be remembered that the rainfall in 1887 was very exceptionally small—16.601 inches, the only approach to this measurement in Dublin being in 1870, when only 20.659 inches fell, and in 1884, when the measurement was 20.467 inches. In seven of the twenty-three years in question the rainfall was less than 26 inches, and in 1883 it was 26.614 inches.

The scanty rainfall in 1887 was in marked contrast to the abundant downpour in 1880, when 32.908 inches—or as nearly as possible double the fall of 1887—fell on 230 days. Only twice since three records commenced has the rainfall in Dublin exceeded that of 1886—namely, in 1872, when 35.568 inches fell on 233 days, and in 1880, when 34.312 inches were measured on, however, only 188 days.

In 1888 there were 190 rainy days, or days upon which not less than .01 inch of rain (one hundredth of an inch) was measured. This was slightly in defect of the average number of rainy days, which was 194.4 in the twenty-three years, 1865-87, inclusive. In 1868—the warm dry year of recent times—as well as in 1887, the rainy days were only 160, and in 1870 they were only 145. In 1866, however, the rainfall amounted to 24.935 inches, or more than 8 inches above the measurement in 1887, and even in 1870, 20.659 inches were recorded. Included in the 190 rainy days in 1888 are 26 on which snow or sleet fell, and 39 on which there was hail. In February hail was observed on 9 days, in March on 11 days, and in April on 5 days. Snow or sleet fell on three days in January, on 11 days in February, on 10 days in March, and on 2 days in both April and November. Thunder and lightning occurred on nine occasions during the year—once in May, thrice in June, twice in July, once in August, and twice in November.

The rainfall was distributed as follows:—6.097 inches fell on 41 days in the first quarter, 6.016 inches on 46 days in the second, 5.879 inches on 44 days in the third, and 10.687 inches on 59 days in the fourth and last quarter.

Of the 10.687 inches which fell in the last quarter of the year, 6.540 inches were measured in November.

Abstract of Meteorological Observations taken at Dublin (40, Finsbury-square, West), during the Year 1888.

MARRIAGES, BIRTHS, AND DEATHS registered in the Year 1888.

I. PROVINCE OF LEINSTER.—MARRIAGES, BIRTHS, AND DEATHS, 1888.

SUPERINTENDENT REGISTRARS' DISTRICTS, ARRANGED BY COUNTIES.*

Wherever the minus sign (-) is prefixed to the number given in the column headed "Excess of Births over Deaths," it denotes that the births, instead of exceeding the deaths, were, in fact, less than the deaths to the extent stated.

No.	SUPERINTENDENT REGISTRARS' DISTRICTS.	Area in Statute Acres.	Population, 1881.	TOTAL			MARRIAGES				BIRTHS				DEATHS				Excess of Births over Deaths.

*Notes.—The Registrars' Districts are subdivisions of the Union or Superintendent Registrar's Districts, and are identical with the Dispensary Districts of the same name, except in a few instances.
The letter H. denotes that the Registrar's District contains within its limits the Workhouse belonging to the Union or Superintendent Registrar's District.
Wherever the number 100 is placed in the column headed "Excess of Births over Deaths," it denotes that the births exceed the deaths, vice versa, in that, less than the deaths in the column noted.*

BIRTHS AND DEATHS Registered in the Year 1883—REGISTRARS' DISTRICTS, arranged by COUNTRIES and SUPERINTENDENT REGISTRARS' DISTRICTS—continued.

		Bellin, . . .	402	Adenagh, . . .	170
		Bellin, . . .	403	Adenagh, . . .	170

* Thus, the number of Marriages in the Abbeyside Superintendent Registrar's District may at once be ascertained by referring to the "District of Marriages" in the Superintendent Registrar's District, numbered at page 46, and in like manner the number of Births and Deaths, or Deaths at different ages, etc., will be found by referring to the same Superintendent Registrar's District Number in the appropriate Tables.

INDEX TO REGISTRARS' DISTRICTS

[The Number or Numbers against each Registrar's District in the Third Column refers to the page or pages in which the Total Births, Illegitimate Births, Deaths, &c., in the District during the year are given.]
